The lecturer then dealt with the question of town-planning and the squares. He said he ought not here to usurp the function of the Royal Commission on the London Squares, but he could not leave without saying a few words on policy. He had noticed that Mr. Frank Hunt, the valuer to the London County Council, was not able to formulate a very definite policy for the redemption of the squares. In the first place, he spoke before the Commission of 231 squares, but, going back to the 1905 count, I calculate that there ought to be at least 361 in which the Council should be interested.

The London County Council's town-planning scheme, which was designed to "save the squares" of eastern Bloomsbury, had been brought forth as the result of the attempt to put a market there, and many people, until they saw it, hoped great things. What did the Council propose? A portion to the south of Guilford-street was scheduled as commercial, and in the years to come we must expect the pleasant Doughty estate, Guilford-place, and other modest residential areas to be slowly transformed in usage.

The two great squares—Mecklenburgh and Brunswick—over two acres in extent, were scheduled as private open spaces, which must have given some satisfaction to the residents and the public, but at what a cost. But the worst was yet to come. The London County Council's town-planning scheme could not prevent a monstrous Babylonian erection of 2,000 flats, 10 stories high, covering the whole of this site, a building which would house 6,000 people and with at least 500 cars put to garage below. The load upon the underground services, water, electricity, gas, sewers, telephones, would require an almost entire reconstruction of the underground system, and for what good end? It all came about because the Foundling Commissioners sold the estate of 56 acres for about one and three-quarter millions. In conclusion, said the lecturer, he would like the audience to know that during five years Parliament made grants to the tune of £549,796, and he had a strong suspicion that the houses and squares were developed with the assistance of that public money.

Discussion.

Mr. H. Christopher Bickmore spoke briefly on the question of Edwardes-square. On a point of fact, he said, squares were divided into two classes, for a certain number were governed by old statutes. These were distinguished from others which had no statutes. In the first case, the expense of laying-out and maintenances was thrown upon residents. The other squares differed in that they were laid out and maintained by the landowners. At the commencement of the battle of Edwardes-square, the residents were actually locked out, but they issued a writ to restrain the owners from carrying out their proposed plans. The case was taken to the House of Lords and the residents won. That should be a beacon-light to others in similar position. Residents, however, rarely knew what their rights were, but even if they did know them it was very difficult to obtain them. One had to see far and think long before one issued a writ.

The Chairman, in proposing a vote of thanks to Mr. Hare, said that the squares formed an essential part of London town-planning. The question arose that when the landowner laid out his square as part of a newly formed town, whether they should not be under a legal as well as a moral obligation, not to alter their plan.

The vote of thanks to the lecturer was carried with acclamation, and proceedings terminated.

Boston "Stump" Church.

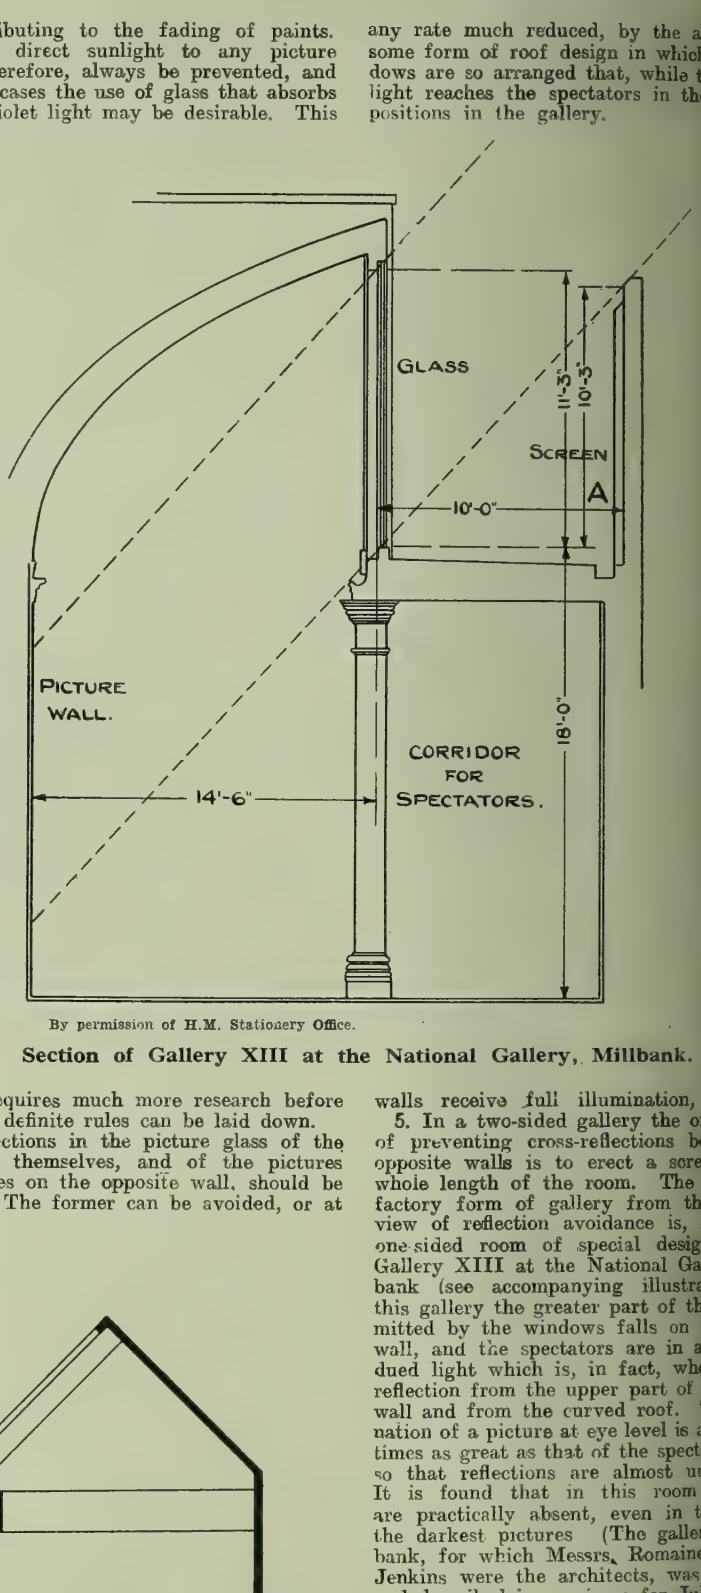
Alarm has been caused by the discovery of decay and damage in the roof and fabric of Boston Parish Church, the famous "Stump." The Parochial Church Council have before them the report of the diocesan surveyor, Mr. L. S. Godfrey, from which it appears that the nave roof has been extensively damaged by the wood beetle and other agencies, and scarcely a sound piece of timber remains. Serious and extending cracks exist in the tower walls. The nave will have to be replaced, the aisle roof restored, and the tower walls require banding and grouting. A moderate estimate of the cost of the restoration is £25,000, and a town's meeting is to be called to consider the position. Meanwhile a stop is to be put to the pealing of the church bells.

An Antiquary's Estate.

Lieut.-Colonel William Edwin Llewellyn Morgan, R.E., of Brynbriallu, Ffynone, Swansea, known as an antiquary and writer of local historical works, until recently a member of the Royal Commission on Ancient Monuments for Wales, who died on July 27, aged 80, left unsettled property of the gross value of £38,767, with net personalty £35,298.

THE NATURAL LIGHTING OF PICTURE GALLERIES

A valuable report on this subject, compiled by Dr. J. W. T. Walsh, of the National Physical Laboratory, has just been issued by the Department of Scientific and Industrial Research (Illumination Research: Technical Paper No. 6).* In a prefatory note it is pointed out that the problem of securing adequate and suitable lighting in picture-galleries without unpleasant reflections in the glass with which the pictures are protected has long been a matter of great interest to architects. Considerable attention has been devoted to it by Mr. Hurst Seager and by H.M. Office of Works, which is responsible for the picture-galleries which house the national art collections. At the request of the Department, experiments were carried out by the National Physical Laboratory on a proposed form of roof lighting. The results of this work, with the concurrence of H.M. Office of Works, have been embodied in this report, together with some later work carried out in connection with the design of the new Duveen wing of the National Gallery, Millbank. The report, which is fully illustrated by diagrams and photographs, consists of six chapters and an appendix, as follows:—Adequacy of Lighting; Suitability of Lighting; Practical Methods of Gallery Lighting; Experiments with Model Galleries; Other Factors in Gallery Lighting; Summary and Conclusions; Appendix; The Lighting of the Raphael Cartoon Gallery at the Victoria and Albert Museum.



The summary and conclusions are as follows:—

1. From the measurements made in existing galleries generally considered to be adequately lighted, it may be concluded that a daylight factor (sill ratio) of about 7 per cent. on the picture wall represents a satisfactory standard of adequacy.

2. The light entering a gallery should not be noticeably modified in spectral distribution, or the pictures will not be seen as they would appear in daylight. The glass of the windows and in front of the pictures should, therefore, be practically colourless, and the decoration of the walls and of the solid parts of the roof should be neutral in tone, especially where they are liable to receive direct sunlight.

3. Ultra-violet light, and even part of the visible radiation, is probably one of the factors contributing to the fading of paints. Access of direct sunlight to any picture should, therefore, always be prevented, and in special cases the use of glass that absorbs all ultra-violet light may be desirable. This subject requires much more research before any more definite rules can be laid down.

4. Reflections in the picture glass of the spectators themselves, and of the pictures and frames on the opposite wall, should be avoided. The former can be avoided, or at any rate much reduced, by the adoption some form of roof design in which the v dows are so arranged that, while the pict light reaches the spectators in their nor positions in the gallery.

War Memorial Arch at Nottingham

The memorial arch erected on the Embankment to the men of Nottingham fell in the war was unveiled at the Armi Day service by the Mayor (Alde Huntsman). The memorial, designed by T. Wallis Gordon, A.R.I.B.A., has gateways, and is built of Portland ste the Roman-Doric style.

TOWN PLANNING INSTITUTE

ıst meeting of the session of this e was held on November 18, at Hall, Westminster, when Mr. G. Harris (President) delivered his tial address, which consisted in the f a survey of the town planning nt in foreign countries. In Ger- ıe said, it had always been possible police authority to influence the nent of towns by withholding its to building operations unless cer- ditions were satisfied. The extent this power had been so exercised mount to a town planning control l mainly on the personality of the in each town or district. Another ristic of German local government inciple that a town council (to use lish term) might do anything for efit of the community which was ifically forbidden it by law—affected lanning in several ways, for it municipalities to buy land to any nd for any purpose and also gave e opportunity of introducing new such as the famous so-called Lex which was a purely local institution ity of Frankfort, called after the its mayor, who invented it.

true that the Prussian Parliament the present time discussing a com- ve Town Planning Bill, but cer- tests made by the Prussian Union s against the Bill were worthy of he Bill would provide for the pay- compensation on account of certain ons in a town planning scheme and an obligation on the municipality hase at a definite time property under the scheme. The Prussian f Towns asserted that these provi- re reactionary and constituted an ient of their historical rights of rnment, since it had been dis- aid down by the Courts that no ation was payable in respect of pro- ontained in a Building Ordinance. Union argued that a town planning vas merely an extension or develop- the Building Ordinance.

is question of general principle stood in much the same position as . The Dutch Housing Act of 1901 wn planning compulsory on all lities of more than 10,000 popula- on smaller ones which showed an of more than 20 per cent. in five nt before the passing of that Act. icipalities possessed full powers re- "public order, morals and health," se covered the control of the ient of the town, as the munici- ight think fit, in the interests of munity. So, too, in Sweden, sys- town planning had been recognised tised at least since 1874, although ot until the passing of an Act in t schemes were made binding on owners. While these were ex- f countries in which, in contradis- to their own case, town planning said to have grown naturally out iously existing powers of local es, they found in the United third and quite different process. ıe initiative had come, not from lature nor from the local authori- from business circles.

art from differences in what might the organisation of town planning, s also a great difference in the sub- ter, and this was especially marked een our system and that of the tates. One would have imagined, ncie. that in a country with an imited extent of land, where new ere constantly springing up and with phenomenal rapidity, atten- uld have been paid to the un- l areas rather than to the existing And yet this was not so. There h talk here of the introduction of nning for built-up areas. When it came, a number of new problems would come with it, and, in attempting to solve them, it would be of great assistance to have before them the American experiences. There are more than 500 cities in the United States which had zoning ordinances. In that country of experiments what a number of solutions of the various intricate problems had been and would be tried, and what an opportunity for them if they knew how to profit by these examples. One point on which we had much to learn from the United States was the reservation of land for purposes of recreation. In the planning of recreation grounds, too, Americans had much to show us—their periodical literature teemed with examples of superb lay-outs.

There were instances of this in other countries also, and he would like especially to draw attention to the case of Duisburg, in Germany. Here there had been extensive excavations of sand and gravel, which might have left the land in the unhappy and untidy state which was unfortunately to be seen in certain parts of England—and in some not very far from London. In Duisburg, thanks to far-sighted town planning control, these excavations were so carried out as to form beds for a number of magnificent lakes, which, being provided with every possible form of equipment necessary for bathing and boating, and being associated with a splendid stadium, formed a recreative centre on a colossal scale which was resorted to daily by thousands of people from the surrounding industrial districts.

The idea of parkways, distinctly of American origin, had already been adopted in a number of town and regional planning schemes in this country, especially along the banks of rivers and streams. A more drastic method of dealing with such cases was to be found in an Act passed by the Prussian Parliament some years ago, which was intended to secure that the borders of all seas, lakes and rivers should be reserved for public use, but, so far as he could gather, that Act had proved to be a dead letter. Another measure which had its origin in Germany was up to the present disappointing in its results. He referred to the famous Lex Adickes—the principle of compulsory replotting or redistribution of land in the possession of a number of owners. He understood that it was found impossible to work it in practice—except presumably in its original home. This was unfortunate, and it was to be hoped that future experience might throw more light on this particular problem, which was one in which American cities might well experiment, provided that it was found to be in accordance with the constitution, on which point, he understood, there was a doubt.

He would draw attention to the activities of the Regional Committee for the Dusseldorf district, which works on very similar lines to their own Joint Committees and to the efforts which are being made in the face of great difficulties to form regional committees for the great central Germany brown coal district, of which Merseburg was the chief industrial centre, and whose area covered the whole of the Prussian province of Saxony and parts of the States of Saxony, Thuringea and Anhalt; for Hamburg and the other authorities at the mouth of the Elbe; and for Frankfort and a group of over thirty counties and county boroughs, whose total population amounted to two-and-a-half millions. Dr. Schmidt had stated that in his opinion the ideal form of development was a Rural Circle (in English terms, an administrative county) systematically planned, but that this form of development was only possible in so far as individual agglomerations of population did not attain the character of great towns.

The Regional Plan of New York and its environs was a tremendous work, while another great regional scheme in America was that of the Niagara Frontier Planning Board, whose area extends about 25 miles inland from Lake Erie and the Niagara River.

The only European country besides Germany in which, so far as he was aware, regional planning was practised to any great extent was Holland. Two years ago a committee appointed jointly by the Dutch Union of Communes and the Dutch Housing and Town Planning Institute devised an elaborate scheme for an Advisory College for Regional Planing, from which Prof. Granpré Moliere dissented on the ground that it would endanger the self-government of the communes. He did not know what had happened to the proposal. He was surprised that Belgium should not have taken up regional planning, for Belgium seems to be a country in which such a policy was eminently desirable, yet even Senator Vinck, with all his energy and enthusiasm, had not created any active movement in this direction in his country.

In France, although regional planning was not yet practised to any large extent, the principle had been adopted, not merely by theorists.

While there were important regional schemes in preparation on the Riviera and about Paris, Lille, Rheims and Strasbourg, it did not appear that municipal schemes were going forward very fast and he gathered that one of the principal reasons for this was the absence of any provision in the nature of our town-planning resolution, with all its consequences. For lack of this provision, private development went on unchecked during the preparation of a scheme by the municipality and the position was therefore in a constant state of flux. Moreover, the openings for claims for compensation were many and the communal authorities were generally, for financial reasons, afraid to risk them. It would seem that yet further legislation was required in order that practical effect might be given to the theories which were being worked out in the admirable Institut d'Urbanisme of the City of Paris and by other organisations in the capital, as a result of which a corps of French town-planners was growing up, who were already making their mark in various parts of the world. He might instance the plans of Smyrna and the work of M. Hebrard in French Indo-China. Moreover, the fact that the French Government had introduced compulsory town-planning into Madagascar led one to expect that French town-planners would soon be busy in that distant land. Turning to Paris itself, they had to recognise that it was at the moment grappling with a great problem in the lay-out of the site of the old fortifications. The idea of creating there a continuous belt of open spaces was a magnificent project such as they, alas, could not hope to emulate. And in connection with Paris we could not but think of the subject of architectural control in town planning, upon which we had scarcely yet embarked in this country. They hoped to hear something of this in a paper to be read by Lt.-Col. Lafontaine, but he would also allude to the interesting information on the subject of architectural control in Sweden and Germany provided in the bulletins of the International Federation for Housing and Town Planning, which were so excellently edited by Mr. Chapman and to which he was indebted for much of the information of which he was making use.

In Italy the town planning movement was confined mainly to the development of certain of the large cities—Rome itself, Milan and Turin—while the lay-out of the new Venice on the mainland was a specially interesting effort. Spain's chief contribution to the science of town planning was the lineal city of Madrid—and he must not be supposed to be in favour of ribbon development if he said he did not think that this lineal city idea should be swept away without any consideration.

Of other countries of Europe, in Finland town planning legislation existed as early as 1854, and a new Bill was in contemplation;

Czecho Slovakia had established a Town-planning Institute, which had issued a number of educational propagandist pamphlets; and the different cantons of Switzerland had a variety of town-planning provisions, in which, as might be expected, special attention was usually paid to the protection of beautiful scenery.

Denmark contained an interesting institution known as a Town Planning Laboratorium, where lectures and meetings of study groups were held. The Norwegian towns had long been active in town-planning and frequently arranged competitions for plans for their extensions and suburbs. Trondhjem, in particular, might be mentioned as a city which worked out a plan for an agricultural belt, with new industrial areas beyond it and, by skilful planning, had created residential suburbs of unusual beauty. Poland had a town-planning division in its Ministry of Health. In Greece an association has been formed to instruct public opinion in town-planning ideas. The much-debated questions, too, of a Greater Vienna, a Greater Prague, a Greater Oslo and a Greater Copenhagen were merely examples of the recognition by the big cities of the world that their future expansion must be in accord with rightly thought-out principles and in other words, that they must town-plan.

If they turned to our Overseas Dominions, Canada had established a Town Planning Institute, and town-planning legislation had been passed by every province except, perhaps, one. If Canada was inspired by one of their members, Mr. Adams, it was another, Mr. C. C. Reade, who had successfully preached the doctrine in Australia. Australia, New Zealand and South Africa might all, one would think, offer a similar field to the town planner as did Canada. In each of those Dominions beginnings had been made. The planning of Australia's capital, Canberra, is a matter of profound importance. Adelaide had always stood as a classical instance of a wise method of town extension. A Metropolitan Town Planning Commission was established by the legislature of Victoria in 1922, the area of the region covering the districts of twenty-five municipalities in addition to Melbourne. New Zealand passed a Town Planning Act in 1926, establishing a central Town Planning Board and making town-planning compulsory for the whole of the area of every city and of every borough having a population of 1,000 and upwards.

In South Africa there seemed still to be some difficulty in getting town-planning actively under way, in spite of the persistent efforts of the Public Health Department of the Union. It was clear that whereas there was a strong movement in South Africa, backed by the Union Government, in favour of town-planning, there were large sections of the population in that Dominion who need to be convinced of its importance.

In India there was no compulsory town-planning except in the province of Madras, but there were legislative town-planning provisions for Bombay and Calcutta, Rangoon, the United Provinces and the Punjab and in several of these provinces there was considerable activity.

The Gold Coast Colony had an ordinance establishing a Central Town Planning Board and making municipal authorities responsible for carrying out schemes. In the Federated Malay States, to which Mr. Reade had transferred his energies for some years past, there were a number of town-planning committees in existence and at least four town-planning administrators in addition to Mr. Reade himself, who is Government Town Planner. Here, too, much seems to be done officially in the matter of publicity and education of the general public in the aims and objects of town-planning. In Palestine, the town of Tel Aviv is an example of the complete planning of a new town.

Centralisation was the main characteristic of Japan's town-planning system, for under the Act of 1919, not only were the municipalities to which the Act was to apply selected by the Government, but all schemes were prepared by the Home Office after consulting the local Town Planning Committee, the Mayors of the Municipalities being responsible for carrying out the plan in their governmental capacity. It was difficult to know for certain what was happening in Russia in any department of life, but he had read a paper by M. Beloborodow, People's Commissioner of the Interior, from which it was clear that the principle of town-planning at any rate was fully recognised by the Soviet Government, while its practice was even more completely centralised in Russia than in Japan.

Professor A. Bruggeman proposed a vote of thanks to the President and referred to the distinguished work done by Mr. Harris in connection with the International Federation. The address given enabled them to obtain a general grasp of the town-planning situation in the world.

Senator Vinck (Belgium), in seconding the motion, regretted that town-planning had not made greater progress in his country. They started in 1919 to try and rebuild Belgium as it should be, but—like other people, they had been disillusioned. Something, however, had been done, and a circular boulevard around Brussels was being planned. Centuries ago Belgium planned its towns on splendid lines. Perhaps it was the same in England and that during the 18th and 19th centuries the town-planning idea was lost owing to the individualistic spirit of the people.

The motion was carried and briefly acknowledged by the President.

WEEK IN PARLIAMENT

WESTMINSTER, WEDNESDAY.

Rent Restrictions.

During the Committee stage of the Expiring Laws Continuance Bill, Captain Bourne moved an amendment to provide that the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920, should be extended only until August 1, 1928, instead of to December 25, 1928. He pointed out that this was the first time the Act had been included in the Bill, and its inclusion precluded any amendment to it. Was it, he asked, the intention of the Government to allow it to remain in the Bill indefinitely? He urged the introduction of an amending Bill next session.

Sir Kingsley Wood, the Parliamentary Secretary to the Ministry of Health, in reply, asked the Committee to confirm the proposal of the Government to continue Rent Restrictions for another year. He said that while it was true that the number of houses built in England and Wales since the Armistice was well over 1,000,000 and that the 52,000 houses completed in September was a "record" in this country for a single month, the Government recognised that a great deal remained to be done. A considerable body of opinion was in favour of the abolition of all forms of restrictions on the ground that they hampered building operations. But the Ministry of Health was bound to have regard to the representations of many of the local authorities, including the L.C.C., which strongly held the view that the time had not come for the dropping of the Rent Restrictions Act. The view of the Government was that the rapid construction of new houses was bringing nearer the time when the Act could be abolished, or at least a drastic amendment made in it without exposing tenants to exploitation or injustice.

The amendment was negatived.

The Subsidy.

Mr. Chamberlain informed Mr. Stephen that the total Exchequer payments made since 1919 in respect of housing schemes in England and Wales to November 12, 1927, amounted to £58,900,669, and the following amounts had been paid in respect of schemes in the county boroughs named :—

Liverpool	£1,707,533
Manchester	920,001
Birmingham	1,408,733

Slum Clearances.

Mr. Chamberlain informed Mr. T. Th that no fixed allocation was made fo chequer contributions towards the ex of slum clearance schemes, the actua penditure each year being dependent progress of the schemes sanctioned. T quirement for the year 1927-28, for provision was included under the housing grants subhead of the vote t Ministry, was estimated at £65,000, a ultimate annual Exchequer liability spect of such schemes approved to 31, 1927, was estimated roughly at £1

Town Planning Schemes.

Mr. Thomson asked how many tow adopted town planning schemes und Housing and Town Planning Act, an many had taken no action in the matte

Sir K. Wood said that there wer boroughs and urban districts with a p tion of 10,000 persons or more. The nu in whose areas town planning action ha taken, either by the local Council another authority, were as follows :- planning resolutions passed, 227; preli statements approved, 58; final schem proved, 13.

Building Trade Operatives.

Sir A. Steel-Maitland, the Minis Labour, informed Mr. H. Williams th estimated number of insured persons fied as belonging to the building tr Great Britain was 833,940 at July, 19 compared with 789,560 at July, 1926 number of such workers recorded as ployed at June 20, 1927, was 52,112, a pared with 68,191 at June 21, 1926. was thus an increase in the numbers ployment of approximately 60,000.

Answering Mr. Buchanan, Sir A. Maitland said that the number of workpeople classified as belonging building trade in England recorded as ployed at October 24, 1927, was 79, compared with 72,754 at October 25 The following statement showed insure people in the building trade in the area [area comprises : Bridgeton, Fin Glasgow, Glasgow (S. side), Govan, Park, Kirkintilloch, Maryhill, Pa Partick, Rutherglen and Springbu corded as unemployed at October 24,

Occupation.	N
Carpenters

Overcrowding.

Mr. Hardie asked the Minister of if he could state the number of famili in one, two, three and four-apartmen and upwards in the United Kingdom

Mr. Chamberlain said that the statement gave the figures for Engl Wales at the 1921 census.

Number of private families occup room, 317,417; two rooms, 917,95 rooms, 1,358,681; four rooms, 2,144, rooms and over, 4,000,958; total, 8,7

Those 8,739,197 private families 7,759,821 structurally separate dwe which 7,006,707 were occupied by on family; 597,807 were occupied by tw families; 155,307 were occupied by more private families.

Prices of Houses.

Mr. Chamberlain informed Sir that the average prices of houses in contracts let by local authoriti the three months ended in Septe were £403 for non-parlour type and parlour type houses, as compared w for non-parlour type and £513 fo type houses, for the quarter ende cember, 1926.

LEGAL SECTION

NOTES ON CURRENT CASES

Land Drainage.

CISION of some interest to those who lls on river banks has been delivered case Salisbury and Fordingbridge e District Board *v.* Southern Tanning d. (1927, 2 K.B., 566). The defend- ere the owners and occupiers of a nill on the river Avon, which they use for its ancient purpose of a corn t to provide electric current for their , and other industrial purposes. The s were a drainage board for the dis- naving powers of Commissioners of under the Land Drainage Acts, 1861 8.

action was brought by the plaintiffs they alleged that the defendants, by to the height of their mill dam or y placing on the top thereof an en- nt of cement concrete and/or a plank cts, had held back the water in the using the adjoining meadows to be and causing wash outs in the banks plaintiffs claimed an injunction to the defendants from enhancing the d from interfering with the plaintiffs performance of their duties and a ry injunction to remove the enhance-

lefence of the defendants was that as no cause of action and they counter- for trespass by the plaintiffs on their . The ground for this counterclaim at the plaintiffs had, after calling e defendants to remove the enhance- one so themselves, and on its being had again removed it. The reason defendants thus raised the weir was ase the power for their works.

question whether the plaintiffs had or proved any cause of action was d from the Assizes, where the follow- ings of fact had been found by the as regards the first question as to the f the water, we must explain that re two marks, one an old water mark other a peg; the contention of the was that the defendants were not to keep the water above the old ark, but the defendants alleged the wed the level acquired by prescrip-

questions and findings were :—That th of water enjoyed over a period ears was less than the defendants up to the peg, but more than the alleged as shown by the old mark. th according to the peg with refer- ordnance datum would be 118 ft. : to the old mark 118 ft. 0¼ in., but found that the depth enjoyed with- rruption would be 118 ft. 2¼ in., the eing 1905 to 1925; they also found present depth was injurious to the of the meadows and that at some tween 1922 and 1924 the height of had been increased.

gards the right of action, the Court out that under the Land Drainage l, there were two methods open to the sioners. Under sections 16 to 20 they ers of actual removal of any obstruc- the drainage, but under sections 17 the Commissioners are not entitled ve or otherwise interfere with any m, weir or other like obstruction the level of the water is raised for ing or other purpose of profit other- n with the consent of the owners, first obtaining the finding of two that the removal of the alleged ob- is necessary for the effectual drain- he district.

ourt found that as this procedure had followed, the plaintiffs had no power he Act to act as they had done and upon the land and remove the ob- struction. Section 60 of the Act provides that all powers given by this Act shall be deemed to be in addition to and not in derogation of any other powers conferred on Commissioners of Sewers by Acts of Parliament, law or custom, and they may exercise such other powers in the same manner as if this Act had not passed, but the Court held that there was no power either under previous Acts or at common law for the plaintiffs to enter on the land and interfere with the defendants' property as they had done, and they had committed a trespass. This part of the judgment is, however, only relevant to the counterclaim for trespass for which an agreed sum of £10 was awarded, as the plaintiffs intended to proceed under the second method mentioned above, viz., under section 33 of the Act. That section provides : "Commissioners of Sewers acting within their jurisdiction may without the presentment of a jury make any order in respect of the execution of any work, the levying of any rate or doing any act which they might but for this section have made with such presentment." The Court did not determine whether the Commissioners under section 33 could enforce the removal of an obstruction such as this or whether they would be entitled to remove the weir without the proceedings contemplated in sections 17 to 20 by making such an order because, in fact, although the plaintiffs were under the impression they had made an order, no order had been made. The question therefore to be determined was whether, apart from the statute, there was any right of action. The Court found that the action was brought upon the footing that the plaintiffs had the right to exercise the same rights as regards the meadows that the owner could exercise, so that unless a prescriptive right to dam the river to that extent could be proved a right to cause the obstruction to be removed could be claimed.

The Court held that on this footing the action was not maintainable because, although under section 47 of the Sewers Act, 1833, their own works are vested in the Commissioners, works only under their "view cognizance or management" are not vested in them, as was held in Stracey *v.* Nelson (12 M. & W., 535), and followed by the Court of Appeal in Nesbitt *v.* Mablethorpe Urban District Council (1918, 2 K.B., 1).

It remained to be considered whether under section 16 of the Act of 1861 the action could be maintained, but the Court held that that section was confined to works and acts which the Commissioners may do to keep in good order, to improve and to add to physical things in their district, and that even if the section does give a right to bring an action, so far "as any mill, dam, weir or other like obstruction whereby the level of the water is raised for any milling or purpose of profit," is concerned, it would be subject to the restrictions contained in sections 17 to 20 and the right could only be exercised after the steps contemplated in those sections had been taken.

It is to be observed that in this case there was no allegation of a public nuisance or of an obstruction to the general drainage of the district, but the Court expressed the opinion that even had it been an action of that kind the plaintiffs would not have been entitled to bring an action for an injunction except after proceedings under sections 16 to 20 or section 33, and even under the latter section it was doubtful whether in the case such as this, relating to a mill, dam or weir, the action could be brought without giving the defendants the rights which are conferred by sections 16 to 20.

In support of this the Court referred to the case of Devonport Corporation *v.* Tozer (1903, 1 Ch., 759), a case where the Corporation were claiming an injunction and declaration that they were entitled to remove certain buildings erected in contravention of the by-laws and in which it was held by the Court of Appeal that where special powers are conferred on public bodies by statute they are confined to the exercise of those powers and without the leave of the Attorney-General have no inherent right to take proceedings.

Assessment for Income Tax of Houses Let as Tenements.

In the recent case, Williams *v.* Sanders (H.M. Inspector of Taxes) (1927, 2 K.B., 498), a case was stated for the opinion of the Court which raised the question as to the proper principle to be applied in assessing buildings let as different tenements under Schedule A of the Income Tax Act, 1918. The house or building in question was owned by the appellant and let in four different apartments or tenements under separate weekly tenancies terminable by a week's notice by either landlord or tenant. The tenants belonged to the poorer classes and the four different apartments were occupied by four distinct tenants and their families with the use in common of the passages, stairs, washhouse, W.C., and front and back entrances, and the rents respectively were 10s. 6d., 7s., 3s. 9d. and 6s., making the aggregate weekly rental £1 7s. 3d., the landlord paying all the rates, water rates and inhabited house duty. All these rents were fixed by agreements, which commenced within seven years preceding the fifth of April next, before the time of making the assessment appealed against. The Commissioners on July, 1924, on an appeal to them, had assessed the property in a sum of £48 gross, a reduction of £2 on the original assessment.

Schedule A, No. VII., rule 8, provides "The assessment and charge shall be made upon the landlord in respect of . . . (c) any house or building let in different apartments or tenements and occupied by two or more persons severally. Any such house or building shall be assessed and charged as one entire house or tenement. . . ." The Commissioners had found "We take the view that in the case of properties let at a weekly rent or let to more than one tenant the gross rents less the rates paid by the owner, less a contingency balance of one twenty-sixth of the net rents at the time of making the assessment, represent the rack rent and therefore we make the assessment £48."

The figures put forward by the Inspector of Taxes before the Commissioners were as under :—

Gross rental of the house, arrived at by adding the weekly rents ...				£70	17	2
Deductions—						
Rates			£15	18	2	
Inhabited house duty			0	12	6	
One twenty-sixth gross rents			2	14	6	
			£19	5	2	
				£19	5	2
				£51	12	0

For the appellant it was contended before the Court that as the house had to be assessed as one entire house, when it had to be ascertained what was the annual value, which is the amount that it is worth to let by the year at a rack rent, a hypothetical rack rent for the house has to be sought, for houses let as tenements cannot be let as one entire house unless to someone who takes it as a middleman in order to let it out on weekly tenements, and as a profit must be allowed to such a person the weekly rents actually paid are not the immediate basis of the annual value. The Court did not accept this contention, as the words of the above rule provide that the assessment in respect of such premises shall be charged to income tax upon the landlord as one entire house or tenement and would not let in a speculation as to a middleman, and in order to give effect to this rule it was unnecessary to introduce an altera

tion in the principle of rating. But the Court directed that the case must be referred back to the Commissioners, for, in the decision they had given, which we have quoted above, what they had done was to construct a profit and loss account and to see how much was to come in, and taken the weekly rents and knocked off one twenty-sixth for contingencies and taken that as the rack rent, but that was wrong. They were right in taking and adding together the weekly rents, but they were wrong in thus taking them and adding them together with a discount. If the weekly rents were taken and added together it must be ascertained what the particular tenements are worth to let at a rack rent *by the year* and nothing else than that. It must be ascertained what a man would give if he had to take the place for a year and be responsible for a year and then the rents can be added up and allowance made for rates, etc. The judge said that he did not know what the result would be—it might reduce or increase the assessment or not alter it.

In the report of the case will be found an assessment made by a rating surveyor on behalf of the appellant, making the rack rent value of the premises £36, but so far as we are able to follow it, that would also offend against the ruling of the Court, as the rack rent of each separate apartment or tenement is not found, but an estimated deduction is made from the aggregate weekly rents, and it refers to a hypothetical tenant of the whole building acting apparently as what the Court termed a middleman. We can only draw attention to the actual decision of the Court as reported.

LAW REPORTS

Wisbech Rural District Council v. Ward.

In this case, in the Court of Appeal, the defendant, Mr. F. B. Ward, an architect, appealed from the judgment of Mr. Justice Sankey at the Cambridge Assizes in favour of the plaintiff Council for £221 3s., which they alleged they had been compelled to pay twice through the negligence of Mr. Ward in granting interim certificates.

The facts of the case shortly stated were these:—In 1920 the Council made a contract with Messrs. Wright and Wilson, builders and contractors, for the erection of a number of houses under a housing scheme, the defendant being the architect under the contract. The Ministry of Health under the scheme could compel war material which the Disposals Board had for sale to be used, and the Ministry had also the right of revising the prices and making allowances in the event of the prices of labour or material rising or falling during the continuance of the contract.

During the years 1920-21, while the houses were in course of erection, the defendant gave 12 interim certificates, the first on November 29, 1920, and the last on November 24, 1921, in pursuance of clause 29 of the contract, which regulated the method of payment.

The defendant also gave documents by virtue of which the Council paid the Disposals Board for certain articles, baths, stores, etc., and he gave some interim certificates and documents under which the Council had to pay both the builders and the Board for the same material, and the amount paid twice over was £221 3s., the sum claimed in the action. When the mistake was discovered, in 1923, the Council endeavoured to get a refund from the builders, but it was not recovered, as the builders had dissolved partnership. Thereupon the Council sued the defendant for the amount.

The defendant contended (1) that he was a *quasi*-arbitrator, and therefore not liable; (2) that the action was premature, because there was power to rectify under a final certificate, which at present had not been issued. Should that final certificate be issued it would be found that the builders had not been overpaid, because a sum of £221 11s. 8d. was due to them for sums they ought to be allowed for paying increased wages; (3) if the matter could not be rectified, there had been a final certificate contained in a document known as Summary No. 4, which was the document gone into between the parties to find what the exact position was, and the defendant had issued his final certificate and could not be sued for negligence; (4) if the defendant were negligent, so, too, were the plaintiffs for not keeping and checking the accounts.

Mr. Justice Sankey held that the position of the defendant was not that of an arbitrator or *quasi*-arbitrator; that he was not when he gave the certificates, deciding any dispute or settling any final balance, but was, in effect, acting as agent for the plaintiffs. He accordingly gave judgment for the Council for the amount claimed, and from this result the defendant now appealed.

At the conclusion of the arguments, the Court allowed the appeal, and entered judgment for Mr. Ward, with costs.

In giving judgment, the Master of the Rolls said it appeared to him that the mistake made in the Court below was in misunderstanding the effect of the duty imposed on the defendant, as architect, under clause 29, and treating the payments made as if there had been a final adjustment between the parties. There had been no final adjustment, and in that sense the action was premature. With regard to the document known as Summary No. 4, he thought the defendant was justified in calling attention to the fact that on the face of it that document showed that a sum of £270 to be paid was less the amount payable to the Disposals Board. The defendant, as architect, was clearly bound to certify for the full amounts both of labour and material, and he had indicated that a certain amount was to be deducted.

Recovery of Architect's Fees.

An issue of some interest and importance to architects and builders was involved in an action which came before Mr. Justice Shearman at Devon Assizes on Friday, November 4. The plaintiff, William John Pearce, architect and surveyor, Princess-square, Plymouth, claimed £166 19s., fees for work done, from Solomon and Renny, Ltd., builders and contractors, Courtenay-street, Plymouth. After a hearing extending over two days, the judge found in favour of plaintiff, awarding him 100 guineas and costs.

ARCHITECTS' & BUILDERS INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Public or Private Road?

SIR,—I should be obliged if any of your readers could give me any information on the following points:—

(1) Can a rural district council take over and make a public highway of a road that is really a cul-de-sac? The end of the road was separated from a public road by a hedge that has gradually been removed, and the entrance was from a main road.

(2) When taking over this road can the rural district council insist upon its being tarpaved, kerbed, and channelled, and the path paved? It can never be anything but a by-road, the traffic being only tradesmen's delivery carts, with the exception that there is a works about halfway along the road, to and from which the traffic is somewhat heavy.

SURREY.

Measuring Painting on Sash and Frame.

SIR,—We have recently made a considerable quantity of double-hung sashes with vertical and cross bars, and it was agreed that we should prime these at so much per yard. We are under the impression that we were justified in supering both sides and charging this measurement to allow for the cutting i the rebate, beads and bars; but it is gested by our customer that this shoul measured up per foot run plus ⅓ allow for members. We should be glad to have opinion on this point. MEASURIN

Open Spaces in Front of Shops.

[REPLY TO "B. P.," NOVEMBER 11.]

SIR,—If the space referred to has not dedicated to the public, then the shopkee can continue to use the space in ques for the purpose referred to, and without closing it as suggested. The object of closing spaces, etc., periodically is to vent any easements such as rights of being obtained over them.

There is nothing to prevent "B. using the space permanently again, ex that under Section 3 of the Public He (Buildings in Streets) Act, 1888, no add can be brought forward beyond the main wall of the house or building on ei side of the same; and, again, in the M polis, under the London Building Act, this addition would constitute a new b ing; and the superintending architect de what the building line shall be in re to such new building. The public ha right of way (see above).

OPEN SPA

Ancient Lights.

[REPLY TO "A. A.," NOVEMBER 11.]

SIR,—The erection of a hoarding is only remedy "A. A." can adopt to pr his rights however "churlish" that tude may be towards a neighbour. It not the duty of the local authority to d prove the plans referred to, for the re given in the query. Those matters do concern the local authority in the sligh All they are concerned with is, if the p etc., comply with their by-laws, and Statutes. If they do, they must app them. If they do not, they must disapp them. The Common Law rights of owne not in general come within their purvie

If the flat roof is used as sugge "A. A." should bring it to the notice o local authority so that it may take pro ings to abate the nuisance. This is the way of approaching the matter; though could be taken by "A. A." against owner of the garage, by way of a civil ac to abate the nuisance, and for damages as to this he had better take legal a before proceeding. LA

Iron or Lead Pipes.

[REPLY TO "F.L.," NOVEMBER 18.

SIR,—This depends entirely on the re ments of the by-laws of the local authori water company concerned. These by-law settled after a consideration of the qual the water supplied in the district an action on iron or lead pipes. "F.L." s obtain these by-laws.

BY-L

Tenant's Fixtures.

[REPLY TO "ELECTRO," NOVEMBER 1

SIR,—If "Electro" can show tha items enumerated, though fixed to premises by the tenant, were nevertheles so fixed for permanent use with or fo improvement of the premises, but that were fixed for the purpose of the te temporary enjoyment of them as chattels that their removal will not cause stru injury to the premises, then they may moved during or at the end of the te The degree and object of annexation a terminating factors.

As a matter of fact, gas fittings have held to be fixtures, and not removable; t in practice they are treated as fixed ch and removable by the tenant.

Applying the above considerations t items given, the following are the an to the queries raised:—(1) No. (2) Ye Yes. (4) Yes. (5) No.

FIXT

THE BUILDING TRADE

E LANDLORD & TENANT (No. 2) BILL—II

AS AMENDED IN COMMITTEE

our last article we considered the amend- introduced in Committee in Part I of andlord and Tenant Bill, which relates npensation for improvements and good- ut the remaining Parts of the Bill have e also examined. Part II contains eral amendments of the Law of Land- nd Tenant," and Part III is "General." 17, which was clause 13 in the original we discussed in some detail in our , June 10 last, and in the present we only intend to refer to the amend- introduced in Committee.

clause, which relates to "limitation on es for breach of covenants to repair," en amended as follows:—Subclause (1) nces as before, "Damages for a breach ovenant or agreement to keep premises air during the currency of a lease, or to premises in repair at the termination of , whether such covenant or agreement ressed or implied, and whether general cific, shall in no case exceed the amount y) by which the value of the reversion ner immediate or not) in the premises ninished" (thus far it follows the l Bill, but then continues) "owing to each of such covenant or agreement as aid, and in particular no damage shall overed for a breach of such covenant or nent if it is shown that the premises, in ver state of repair they might be, would shortly after the termination of the y be pulled down, or such structural ions be made therein as would render ess the repairs covered by the covenant eement; Provided always, that the fore- provision shall not exonerate the tenant liability under any covenant to repair necessity for pulling down or for the ions as aforesaid is due solely to the t, act, or default of the tenant."

vill be seen that the amendment does fect the observations we made in our article of June 10 in relation to the as a whole, but it does supply the on we there pointed out that the clause ginally drawn did not carry out the ent made by the Attorney-General that ll was intended to deal with cases where emises were to be pulled down at the ation of the tenancy.

only other amendment made in this is in subclause (2), which now provides disputes arising during or at the ter- on of a lease as to the amount of es for breach of such covenant or agree- may, if both parties agree, be referred tribunal. This is important, as under iginal Bill the dispute might be so re- "at the instance of either party."

se 18, subclause (1), which was clause he original Bill, which relates to "Pro- s as to covenants not to assign without or consent," is amended as follows:— bclause, as originally framed, only ap- to leases made after the commencement s Bill as an Act; now it is to apply to ses, whether made before or after the encement of the Bill. This amendment endered necessary the omission of the "unless made in pursuance or in con- ce of a covenant, condition, or agree- contained in a lease made before the encement of this Act"; so thus far the provides that in all leases, whether before or after the commencement of ct, containing a covenant, condition or nent against assigning, underletting, ng, or parting with the possession of, ed premises or any part thereof without e or consent, such covenant, etc., not- tanding any express provision to the contrary, shall be subject to a proviso to the effect that such licence or consent shall not unreasonably be withheld; but then follows a new provision: "And (if the lease is for more than 40 years, and is made in consideration wholly or partially of the erection, or the substantial improvement, addition or alteration of buildings) to a proviso to the effect that such licence or consent is only to be required to any assignment, under-letting, charging or parting with the possession (whether by the holders of the lease or any under-tenant, whether immediate or not) during the last seven years of the term."

Subsection (2), which relates to covenants, etc., against the making of improvements without licence or consent, and which imposes a proviso that such consent shall not be unreasonably withheld, but which provides that this proviso shall not preclude the right to require as a condition of such licence or consent the payment of a reasonable sum in respect of any damage to, or diminution in, the value of the premises or any neighbouring premises belonging to the landlord, is amplified by the following addition: "And of any legal or other expenses properly incurred in connection with such licence and consent, nor, in the case of an improvement which does not add to the letting value of the holding, does it preclude the right to require as a condition of such licence or consent, where such a requirement would be reasonable, an undertaking on the part of the tenant to reinstate the premises in the condition in which they were before the improvement was executed"; and the subclause provides that any difference as to the reasonableness of any such sum or requirement shall, if both parties agree, be referred to the tribunal. Under the original Bill the reasonableness of any sum *had* to be referred to the tribunal.

The body of subclause (3), which relates to covenants against any change in user, remains as before, but the clause relating to differences has been altered; it now reads: "Any difference as to the reasonableness of any such sum shall, if both parties agree, be referred to the tribunal, and where a dispute as to the reasonableness of any such sum has been determined by a Court of competent jurisdiction or the tribunal, the landlord shall be bound to grant the licence or consent on such terms as the Court or tribunal consider reasonable."

There is a new subsection (4) that this clause shall not apply to leases of agricultural holdings within the meaning of the Agricultural Holdings Act, 1923. This concludes Part I, as clause 19 represents unchanged clause 15 of the original Bill.

PART III.

The Tribunal.

There is no change in the constitution of the tribunal as laid down in clause 18, subclause (1) of the original Bill, but in the Bill as amended, clause 20 contains a long proviso as follows: "Provided that where a claim for compensation or the grant of a new lease has been made under this Act, and it appears to the High Court or a judge thereof on an application made for the purpose by the claimant or other person affected by the claim, that on account of the magnitude of the claim and the questions of law involved the case is one which it is desirable should be tried in the High Court, the High Court or a judge thereof may order that the claim shall be tried in the High Court; and in the event of the claimant and all persons affected by the claim agreeing that the claim shall be tried by the High Court, the claim shall so be tried, and the High Court shall be the tribunal for the purposes of the foregoing provisions of this Act."

Our note in our article of June 10 last, under the heading "The Tribunal," requires correction now the meaning of the Bill has been made clearer, as we erroneously considered some cases might be tried in the High Court, whilst others might be dealt with by the tribunal.

The scheme of the Bill is yet not entirely clear. As regards compensation for improvements and for goodwill, "in the absence of agreement between the parties" the matter has to be settled by the tribunal (see clause 1 (3) and clause 4 (3)), but as regards the grant of a new lease under clause 5, unless by implication (see subclause (3)), there is no express provision that the matter can be agreed, unless in the one case under subclause (7), where the landlord offers to sell. Parties cannot be forced before any tribunal except in criminal matters, but as the Bill in other clauses mentions the absence of agreement, it would appear desirable to bring clause 5 into line with the previous clauses.

Apart from this point, the scheme is that, apart from agreement between the parties *prima facie*, the tribunal is to decide such matters; but this does not prevent the parties from referring any matter to arbitration, for clause 21 provides: "Nothing in this Act shall prevent an agreement being made for referring to arbitration, under the Arbitration Act, 1889, any matter which under this Act is to be determined by the tribunal. This would include the question of a new lease under clause 5. This clause, which was 16, subclause (7), in the original Bill, has now had added to it: "Such an agreement may be contained in the original lease, or may be made in writing at any date subsequent to the date of the lease." It is to be observed that in cases arising under clauses 17 and 18 of Part II. it is optional whether the parties go before the tribunal.

Then the proviso to clause 20, which we have set out above, has to be considered. The drafting of that proviso leaves something to be desired, but it appears that it gives the High Court jurisdiction in cases where it is shown that the magnitude of the claim or the questions of law involved make it desirable, and it also provides that jurisdiction may also be given to the High Court by agreement between all the parties affected by a claim. But it is important to observe that when the High Court so acts "it shall be the tribunal for the purpose of the foregoing provisions of the Act," which, we take it, means that a decision given by the High Court will not be open to review in the ordinary way, but will be subject to the limits as to appeal imposed upon decisions of the tribunals in subclause (3), which we shall refer to below.

Subclause (2) has been amended in one small particular. The Reference Committee (which is constituted as laid down in subclause (6), the President of the Law Society having been added in Committee) may make rules as to the manner of selection of the referees amongst other matters, and in the Bill as amended it is provided "regard being had to the knowledge of the locality possessed by such referee."

Subsection (3) has been much amended. It commences as in the original Bill: "The decision of the tribunal on any question of fact shall be final and binding on the parties and the persons claiming under them respectively," but then is altered and now continues, "but the tribunal may and shall if the High Court so directs, state at any stage of the proceedings in the form of a special case for the opinion of the High Court any

question of law arising in the course of the proceedings, and may state its award as to the whole or any part thereof in the form of a special case for the High Court, and an appeal shall, with the leave of the High Court or the Court of Appeal, but not otherwise, lie from the High Court to the Court of Appeal, and the decision of that court shall be final and conclusive and shall not be subject to appeal to any other Court." It is the latter part of this clause which we suggest will apply to the High Court when it sits as a "tribunal" under subclause (1).

Subclause (4) which deals with costs which was clause 16, subclause (4) in the original Bill, is amended in that the subclause now commences "Subject to rules made by the Reference Committee" the costs of any proceedings shall be in the discretion of the tribunal, and the costs ordered to be paid instead of being taxed by the tribunal itself are now to be "taxed by such officer and in such manner as may be prescribed." The word "prescribed" is defined in clause 24 as meaning prescribed by regulations made by the Reference Committee.

A new paragraph has also been added to subsection (4) as follows:—"The Rules of the Reference Committee made under this subsection may provide for applying subject to the necessary adaptations and exceptions the provisions of subsections (1), (2), and (3) of section 5 of the Acquisition of Land (Assessment of Compensation Act, 1919), relating to costs of proceedings under that Act." Those rules apply to unconditional offers, to failure to give sufficient particulars of claim and so on.

Clause 21 is new, and gives the tribunal power, where it has fixed a time for the doing of any act or thing, to extend the time.

Clause 22, which relates to services of notices, is amended by requiring any notice, request, demand, or other instrument to be in writing, and by a provision as to local or public authorities, statutory and public utility companies, in such cases the registered letter shall be addressed to the secretary or other proper officer at the principal office.

Clause 23 contains a new subclause (3), not contained in clause 18 of the original Bill: "Where the landlord is an incumbent of a benefice (*a*) documents required to be served upon the landlord shall also be served upon the Ecclesiastical Commissioners; (*b*) the Ecclesiastical Commissioners shall be entitled to appear and be heard at any proceedings at which the landlord would be entitled to appear and be heard; (*c*) the incumbent shall not be entitled to offer the grant of a renewal of tenancy without the consent of the above Commissioners; (*d*) any order of the tribunal for the grant of a new tenancy by the incumbent shall be binding upon the Commissioners; (*e*) no consent other than that of the Commissioners shall be required to the renewal of a tenancy in pursuance of such offer or to the grant of a new tenancy in pursuance of such an order.

Subclause (4) is also new. It provides that where any land is vested in the official trustee of charity lands in trust for any charity, the trustees of the charity and not the official trustee shall be deemed to be the landlord for the purposes of this Bill.

Some amendments have been introduced into clause 24, the interpretation clause numbered 19 in the original Bill. The definition of "tenant" remains the same except the word "actual" before the word "possession" is omitted. A definition of "landlord" is now included. The expression "landlord" means any person for the time being entitled to receive the rents and profits of any premises. The definition of a lease remains unchanged, except, as we have pointed out earlier in these articles, the words "or other tenancy" have been introduced.

As mining leases are now excepted from the operation of Part I. of the Bill (see clause 16), a definition of "mining lease" is now given. "Mining lease" means a lease for any mining purpose or purposes connected therewith, and "mining purposes" include the sinking and searching for, winning, working, getting, making merchantable, smelting, or otherwise converting or working for the purposes of any manufacture, carrying away, and disposing of mines and minerals, in or under land, and the erection of buildings, and the execution of engineering and other works suitable for those purposes."

It will be seen that some necessary amendments have been made in this Bill in its passage through Committee, but legislation of this kind, it must be recognised, is attended with considerable drawbacks, as was shown by the Rent Restriction Acts. Certain kinds of property under such legislation can only be owned under legal advice, and the owners are rendered liable to litigation or the direction of a tribunal in their everyday dealings with their property.

Such meticulous legislation is a development of modern times, but it may be doubted whether, when certain grievances call for redress, such complicated legislation is needed for their remedy, or whether the object could not be attained by a simple declaratory statute, the provisions of which could be observed by the parties and enforced by the Courts, failing such observance.

THE INSTITUTE OF BUILDERS

Licentiate Discussion Club.

The third annual dinner of this Club was held at the Comedy Restaurant, W., on Saturday, November 19.

In responding to the toast of "The Club," Mr. W. H. Lee, L.I.O.B., Chairman of the Club, who presided, extended a hearty welcome to the new members. For their information he explained that during the winter the Club met monthly at the headquarters of the Institute for lectures, addresses and debates; and, during the summer, studies were made of buildings in progress. He hoped that the new members who had recently passed the Institute's examination would throw themselves heartily into the activities of the Club, which the older members had found so pleasant and beneficial. The Club now contained men who were gravitating from building to surveying, and men who were gravitating from architecture and surveying to building. This feature offered excellent opportunities for the exchange of views and for a discussion on broad lines of building problems as they affected the three great services of the building industry. He felt that they owed a debt of gratitude to the Council of the Institute for the Club's foundation and for the sympathy and encouragement which had been extended to it at all times in connection with its development.

Other toasts were "The Honorary Secretary, Mr. C. I. V. Curtis, and the Committee" and "The Guests." During the evening an excellent musical programme was provided.

Round Strand Steel Wire Ropes for Cranes.

The British Engineering Standards Association has just issued a British Standard Specification for Round Strand Steel Wire Ropes for Cranes. This has been prepared by committees representative of both the buying and manufacturing interest, and it will be reviewed as experience of its working or progress in the industry renders it necessary, and revised issues published from time to time. Recommendations have been included in the specification in the form of a foreword for the guidance of designers and users. Specifications for Lift Ropes and for Colliery Winding Ropes are also in hand by the committees and will be published as and when they are completed. Copies of the Crane Rope Specification (No. 302) can be obtained from the B.E.S.A. Publications Department, 28, Victoria-street, London, S.W.1, price 2s. 2d., post free.

BUILDERS' BENEVOLEN INSTITUTION

Annual Dinner.

The 75th annual dinner of this Institut was held in the Edward VII Rooms, at Hotel Victoria, W.C., on Thursday last w the President, Mr. Frank J. Walton, F.I.O being in the chair. At the end of the eve the President was able to announce that sum of £1,900 had been subscribed tow the funds of the Institution.

The loyal toasts having been honou Mr. A. H. Adamson, F.I.O.B., proposing toast of "The B.B.I. and its Preside said the builder was more at the mercy adverse circumstances than any other dustry, and the main reason for his comin grief was over the ticklish matter of mating. In recent years the building indu had begun to realise the importance of countancy and costing, with good res But they were often between the devil the deep sea, between the necessity for ing and the need to quote competitive fig if they were to stand a chance of getting contract. They had more than one wol the door, and it made builders "throw the sponge," when they could look tow the "B.B.I" with relief. Regarding t President, they all knew that he had a l heart, and he put down Mr. Walton's ha ness to his readiness to help others. Institution was fortunate in having hi their President.

The President, in responding, thanked proposer for his kindly remarks. Since inception of the Institution, pensions had granted to 250 men and 200 women—the being master builders who had been in ness at least ten years. He felt it only that he—on behalf of the company pres should pay honour to Mr. Archie Coll his work on behalf of the Institution, a the others—notably Mr. Ben Carter and Rudderham—who had also done an enor amount of work in furthering the interes this Institution.

Mr. A. B. H. Colls, F.I.O.B., prop "The Builders' Merchants and Trades," said that they were very glad chance of offering thanks to the builders' chants and the allied trades for their h not only for this year, but in the past. year's list showed that they had suppor nobly. In addition, they had taken a active interest in the progress of the In tion. He had great pleasure in coupling the toast the name of Mr. H. Anderson.

Mr. Anderson, in replying, said that h pleased to be able to go away feeling th builders' merchants had done somethi help the Institution.

Mr. G. J. Aldous, M.C., proposing Visitors," said that it was a pleasure present so large a number of architect surveyors. It was not only from builde the Institution received support. No than 37 architects and surveyors were butors to this year's list. Their gen was greatly appreciated.

Mr. J. M. Theobald, F.S.I., re thanks. The toast of "The Vice-Pres Trustees, Committee and Stewards" w posed by Mr. R. L. Roberts, M.A., F. and seconded by Mr. Ben Carter, a evening concluded with a musical ent ment.

University Site in Bloomsbury.

Statutory authority is sought in the L County Council (General Powers) Bill presented in 1928, for (*inter alia*) e the University of London to vary or guish rights of way in Bloomsbury. poses also "to enable the University propriate all such streets or parts of and the sites and soil thereof for the of facilitating the erection of buildi connection with their work," and to incidental works.

RATES OF WAGES IN THE BUILDING TRADE

For rates of wages in the Building Trade in Scotland see page 840.)

NEW BUILDINGS IN LONDON

Caroline-street.—PREMISES.—New premises are to be erected at 18, Caroline-street. Messrs. Cropley Bros., Ltd., of Church-road, Epsom, are the builders, and Messrs. Hendry & Schooling, AA.R.I.B.A., 53, Doughty-street, W.C.1, are the architects. Demolition work has been carried out by Mr. E. White, of Tooting.

Downham.—PREMISES.—The London County Council has recommended that, subject to the consent of the Minister of Health, a site at Downham with frontages to Downham-way, Moorside-road and Capstone-road be let to Messrs. Barclay, Perkins & Co., Ltd., for the erection of a refreshment house.

Euston-road.—EXTENSIONS.—A dinner in aid of the extension fund of the Elizabeth Garrett Anderson Hospital has been held. The extension aimed at is the provision of 109 beds, of which 22 will be in private wards, and funds are also required for a nurses' home.

Hackney.—BUILDING.—Messrs. Hobden & Porri, architects, 37a, Finsbury-square, E.C., have prepared plans for the erection of a new building at Nos. 92-100, Stoke Newington-road, abutting on Somerford-grove, E.

Hendon.—CONVENIENCES.—The local Urban District Council are to erect four public conveniences. Mr. A. O. Knight, engineer to the Council, has prepared the plans.

Kennington.—CONVERSION.—Messrs. Higgs & Hill, Ltd., of South Lambeth, have obtained the contract for the conversion of the old brewery premises into a factory for the Marmite Co., at Durham-street, Kennington Oval.

Kensington.—FLATS.—Messrs. Higgs & Hill, Ltd., have secured the contract for the erection of flats at Melbury-road, W.8, for the Prudential Assurance Co. Messrs. Josephs, architects.

Kensington. — CLINIC. — The Kensington Borough Engineer has prepared plans, for which tenders are now being invited, for a new infants' welfare centre and five flats in Kenley-street and Sirdar-road, North Kensington.

Lewisham.—SCHOOL.—Another new elementary school is to be erected on the Grove Park estate, Lewisham, at an estimated cost of £21,610 for the L.C.C.

Lewisham. — HOUSES. — Another housing scheme, consisting of 154 houses, is to be carried out on the Downham estate, Lewisham, for the London County Council. Plans have been approved.

Stepney. — REBUILDING. — Mr. Bernhard Baron, chairman of the Carreras, Ltd., has given £50,000 towards the rebuilding of the St. George's Jewish Settlement, Betts-street, Stepney. The existing buildings are to be demolished and a new settlement erected on a site of about 11,000 sq. ft. The new buildings will comprise six clubs for men, women and children, and a poor man's lawyer and general information bureau.

Streatham Hill.—PREMISES.—The buildings on the site of Nos. 54-66, Streatham-hill, S.W., are now being demolished by Mr. E. White, of Tooting, for the erection of a new building, which is to cost £250,000. Mr. B. Brown, of Lennox House, Norfolk-street, Strand, is the architect.

Twickenham.—FLATS.—The Borough Council of Twickenham are inviting tenders for the erection of 11 blocks of flats comprising 68 tenements on land situate in Colne-road and Mereway-road. The Borough Engineer and Surveyor has prepared the plans.

London Water: Increased Rate.

The decision of the Metropolitan Water Board to increase the water rate in London from 6 to 6½ per cent. of the rateable value of the property in which the water is supplied is referred to in the report of the board for the year ended March 31 (Messrs. P. S. King & Son, Westminster, 5s.).

Plugs and Sockets: British Standard Specification.

This new specification (No. 196, 1927) for Reversible Protected-type Two-pin Plugs and Sockets with earthing connections, for circuits up to 250 volts between any two poles, has just been published. In order to remove the confusion which often exists in the minds of the public as to which portion constitutes the plug and which the socket when these fittings are applied to portable apparatus, the opening section of the specification deals with definitions of these parts and their components, and also of various types of plugs and sockets. In the specification proper, the material, construction and dimensions of the plug and socket portions are completely specified for the three standard sizes, the sizes being in terms of the rated current-carrying capacity. Thus interchangeability between plugs and sockets made by different manufacturers, and non-interchangeability between differently-rated plugs and sockets, are ensured. The specification calls for the case of the plug portion to be provided with a petticoat so that the contact-pins are completely enclosed as soon as they enter the contact-tubes, full protection to the operator thus being secured. The Committee responsible for this specification recognised the desirability of a non-reversible feature for some applications of the plug and socket, but it was nevertheless considered convenient only to provide for the reversible type in the specification proper. In an appendix, however, details of construction and dimensions of a non-reversible plug and socket are referred to. A further appendix gives drawings and dimensions of, and notes on, the proposed gauges for inspection of both the reversible and non-reversible plugs and sockets. Copies of the specification may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria-street, London, S.W.1, price 2s. 2d. post free.

TENDERS

Received too late to Classification.

Bridlington.—Additions and alterations to wood," Flamborough-road, for Mr. H. J. S ton. Mr. F. Vaux, architect, Danesmoor-cha Quay-road :—

*Witting & Walker, Ltd., Bridlington.

FIRE.

Bridlington.—Lounge café and entertainment hall on promenade been practically destroyed by fire, damage being estimated at £20,000.

Building Trade: Employment Conditions for October.

Employment showed a further general decline during October, says the *Ministry of Labour Gazette*. It was fair to fairly good on the whole with skilled operatives, other than painters, although it was reported as poor or slack at some centres; it was moderate in most districts with unskilled workers. As compared with October, 1926, employment was not so good with most classes of skilled workers, although it was adversely affected in 1926 by a shortage of materials arising out of the stoppage in the coal-mining industry. As regards individual occupations, employment declined with carpenters, bricklayers, masons and plasterers, and was only fair in most districts; the decline was most marked in the case of plasterers. It also showed some decline with slaters and plumbers, but was fairly good with the former in the majority of districts and fair to fairly good with the latter. Employment showed a further seasonal decline with painters and was generally slack or moderate; it remained moderate, on the whole, with tradesmen's labourers.

Sandgate Castle.

Sandgate Castle, built in the reign of Henry VIII. as part of a coastal defence scheme against the French invasion, is for sale. The Southern Railway, the owners, have offered to sell their interests in the castle to the Sandgate Council for £1,000, but the offer has been rejected.

PLUMBING TRADES' NATIONAL APPRENTICESHIP COUNCIL

FOLLOWING is a memorandum of the meeting of this Council, which was held on Thursday, October 27, at 81, Gower-street, W.C. :—

A letter from the South-East Lancashire area was brought up in which it was stated that boys other than those in the trade were being admitted to the special practical classes for plumbing in the day time at Southport, and suggesting that the Board of Education should be asked to prohibit such attendance. It was pointed out that this was not a matter in which the Board could interfere, and that the local authority would also probably be unable to refuse admission to sons of ratepayers. At the same time the meeting was of the opinion that students actually engaged in the trade could legitimately expect to have first claim upon the accommodation and staff.

The following progress was reported :—

North-East Lancs and District.—In the absence of Mr. Thacker no detailed report was presented, but it was stated that the scheme was proceeding satisfactorily.

North-East Coast.—A meeting of the Council had been held on October 10, at which eight indenture forms for apprentices were signed by the chairman, bringing the total number indentured to 159, in the employment of 59 firms.

South-East Lancs.—Mr. Morris said that 13 boys had been indentured. The indentures of 11 other boys were being held up by the wages question. The masters were taking a real interest in the scheme, and as soon as these difficulties were overcome he felt sure it would go along very satisfactorily.

Birmingham.—Mr Hoey reported that a Joint Council of Masters and Operatives had been formed and had appointed a sub-committee to draft a scheme which had been drawn up and printed. Nothing further had happened since then. Presumably they were waiting for a further meeting of the Joint Council.

Manchester.—The secretary for the Manchester A.C. had forwarded a report enclosing minutes of a meeting held on June 21, and stating that the scheme was progressing satisfactorily. The majority of the towns in the area held regular meetings of their Local Apprenticeship Councils, and were making every endeavour to complete their registers so that full particulars of all the apprentices in the area might be available. Minor difficulties arose owing to the fact that there were two schemes in the area, but it was hoped that by arrangement with the builders, all apprentices to the plumbing craft would be indentured through the plumbing scheme Progress was also reported not only in Manchester but in Leigh, Oldham, Stockport, Wilmslow, and Bolton.

London Central Apprenticeship Council.—The Secretary reported that the progress in London was disappointing, judged by the number of lads apprenticed under the scheme.

Hull.—Apprenticeship in Hull was at present being carried out under an apprenticeship scheme, approved by a local committee of the building trades, that came into operation in January, 1924. This scheme was not one which could be approved by the National A.C. A joint meeting of employers and operatives had been held and the employers had turned down the national scheme. Mr. McKenna reported that the employers had been requested to reconsider their decision.

The award of the lead manufacturing prizes was reported as follows :—

Arthur L. Simpson (24), plumber, Loughborough, 1st prize (£3), Final Exam., major course.

Frank A. Andrew (21), plumber, Brighouse, Exam. at Huddersfield, 1st prize (£2), Final min. course

Secretary presented a financial statement showing a balance in hand of £12 at October 24, 1927. It was agreed that Messrs. Smyth & Bew should be asked to audit the accounts before the annual meeting.

Mr. Hugh Davies submitted a list of plumbing apprentices in the various towns, as appended.

The annual meeting was fixed for Wednesday, December 7, 1927.

At the request of one of the members the chairman said he would look up the point as to the possibility of legally indenturing a son to his father.

The following provisional information from the Board of Education on part-time day classes for building trades apprentices as at November, 1927, was given :—

Plumbing Apprentices.—The following are centres at which arrangements are made for attendance of apprentices at part-time day classes (with the number of apprentices attending) :—

Ashton-under-Lyne Tech. School... ...	13
Barnsley Mun. Tech. College	6
Blackburn Mun. Tech. College	37
Blackpool Tech. College	20
Bolton Tech. College	9
Bradford Tech. College	7
Bristol Temple Tech. School	1
Cardiff Tech. College	9
Worcester Tech. College	1
Falmouth Day Continuation School ...	1
Leeds Technical College	58
Liverpool Central Tech. School	48
London : Northern Polytechnic	1
Manchester Bld. Apprenticeship Sch. ...	47
do. College of Technology ...	29
Northwick Tech. School	3
Oldham Tech. College	52
St. Helens Mun. Tech. College	7
Stockport Tech. College	7
Swansea Tech. College	10
Widnes Tech. College	2
	368

To this should be added some apprentices at Leicester Municipal School of Art, and possibly at Huddersfield Technical College and Halifax Technical College regarding which information is at present incomplete.

Note.—At Ashton-under-Lyne and Blackburn the part-time day classes are arranged for plumbing apprentices only. At Oldham there are courses for plumbing apprentices and for painting and decorating apprentices. At all other centres there is provision for other building trades as well. At ten centres of part-time day instruction for building apprentices there are no plumbers in attendance. Plumbing apprentices attending at the Manchester School for Building Apprentices are transferred at the end of two years to the College of Technology for more advanced work in plumbing and sanitation.

Further particulars of the classes will be included in a forthcoming report on part-time day classes of instruction for apprentices to be issued by the Board of Education.

New Cement Works.

We learn that Messrs. G. & T. Earle are about to erect a large cement works near Hope, in Derbyshire. The works will be about 14 miles from Sheffield, 25 miles from the centre of Manchester, and they will also serve the Chesterfield, Barnsley and Potteries area. The Hope Valley is one of the most beautiful districts in England, and we are told that elaborate precautions are being taken to ensure that this beauty will not be spoiled. The works are to be placed at a distance from the main road, and a considerable amount is being expended to make the plant as attractive as possible. Electric power will be used for driving the plant.

TRADE NEWS

Crane Navvy Excavators.

One of the most interesting exhibits recent Public Works, Roads and Tra Exhibition at the Royal Agricultural Ha the "Ruston" No. 4 Excavator—paraffin driven—which is put on the by Messrs. Ruston & Hornsby, Lt Sheaf Ironworks, Lincoln. This is a universal excavator of the full circle o navvy type, with a ½ cub. yd. bucke is a machine which may be adapted as a dragline, grabbing crane, skimmer bac-acting trencher, or ordinary loco. It is a one-man engine, rendered self-co by the internal combustion engine, independent of rail or prepared roads t being fitted with caterpillar tracks—a likely to make itself invaluable when u housing estates and other unde country. The approximate weight is 1 and further specification is as foll Length of jib, 16 ft. 9 in.; b.h.p. of 36. Alternate drivers of steam or can be fitted if required. The company London office at 15-19, Kingsway, W.C

Smithfield Club Cattle Show.

We learn that Messrs. Tangyes, Lim Cornwall Works, Birmingham, stand above show will be No. 19 in the Mai and the items comprising their exhib include :—One 29-b.h.p. heavy fuel oil cold-starting type; two "Tan-Gyro" fugal pumps; one 4 in. by 6 in. v treble ram pump; one 5 in. six-stage t pump, and also a collection of their blocks, screw and hydraulic lifting jac cluding new design hydraulic ship jac an interesting new type hydraulic mo lorry jack.

A Booklet on Elevators.

Messrs Medway's Safety Lift Co., 1 and 2, Silex-street, Blackfriars-roa have just issued an attractive new bo their electric lifts. These lifts are m tured in conjunction with Messrs. J Hall, Ltd., of Dartford, who have s equipped their works for economical tion of lifts of all descriptions.

A Paraffin Vapour Lantern.

For builders and contractors and who, by the nature of their busin compelled at times to work after lantern which will yield steady and illumination, which can be placed or p anywhere convenient, and which is guishable by wind or rain, is very n It is claimed that the Tilley (Patent) Vapour Lantern fully satisfies these conditions, a lamp for which it is that it is thoroughly safe, and gives a light for six hours at a cost of 1d. particulars may be obtained from the the Tilley Lamp Company, Brent Hendon, N.W.4

Change of Name.

We learn that Messrs. Arthur C of Park Way, Luton, the builders, d and engineers, have changed their H. C. Janes, Ltd., the new name on and from November 1, 1927. change of name only, there being tion in the management or capital. that Mr. Arthur Cole retired from ness some time ago, and that the head, Mr. H. C. Janes, has been with the firm some twenty-three ye firm possesses an up-to-date joine concrete works, and also runs its ow lorries.

Electric Lifts.

We have received a copy of t issued Morris handbook, which d "Electric Lifts." Lifts for good passengers are described and illustr there is even a liberal section d hand-operated lifts and platform Messrs. Herbert Morris, Ltd., borough, will be pleased to forwa of the book on request.

LEAD PAINT POISONING

Under the title of "The Painter and the Law," Messrs. J. E. Butterworth & Clifford G. Conolly have published—through the British Waterproof Abrasiors, Ltd., Brimsdown, Middlesex—a booklet dealing with some matters of legal interest and importance to painters. It incorporates the text of the regulations under the Lead Paint Act, 1926, and contains a short explanation of that and of the circumstances which led to it. The numerous prosecutions in various parts of the country for failure to register show the widespread ignorance as to the duties and liabilities incurred under the Act. We quote from the booklet the following passage:—"The sole object of this Act is to prevent lead poisoning among painters. There are no complete statistics, yet such figures as do exist and the number of awards under the Workmen's Compensation Acts prove that the danger, although sometimes exaggerated, is real. Lead poisoning is usually very slow. It affects different people very differently. One man may breathe lead dust for a long time without being affected. Another may be made ill by very little lead. Fortunately, one fact is now proved. *The real cause of lead poisoning is lead dust caused by dry rubbing down, and this can easily be avoided.* Present medical opinion is set out in the leaflet which has been prepared by the Home Office and has to be distributed by employers to the operatives. It contains these words—'So long as paint ready mixed with oil is used and in a cleanly way, painting operations, involving no dry sand-papering, ought to be harmless and not give rise to any poisoning; you may be quite certain about this.'"

Proposed New Hospital, Bath.

The Bath City Council have received a unanimous recommendation from the Health Committee to proceed forthwith with the complete scheme for the erection of a new Infectious Diseases Hospital at Claverton Downs, in accordance with the plans prepared by the City Engineer. A recommendation has also been made to apply to the Minister of Health for sanction to borrow £51,710 for the work.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Cramond.—POLICE STATION.—The provision of a police station at Cramond is recommended by a Sub-Committee of Edinburgh Lord Provost's Committee. The proposal is that a site for the purpose should be acquired in the Water Park, opposite Cramond Church.

Edinburgh.—BUNGALOWS.—The Dean of Guild Court has granted the following:—Corporation—twelve houses at Sleigh-drive, Lochend; and Lothian Building Co.—three double bungalows at Orchard-terrace and Orchard-bank.

Cardenden.—HOUSES.—Tenders have been accepted for various works to 50 houses on the Woodend site, Cardenden. Mr. W. Williamson, F.R.I.B.A., of Kirkcaldy, is the architect.

Ayr.—SWIMMING POND.—The Town Council has adopted a recommendation by the Works Committee that the Burgh Surveyor be instructed to prepare plans of a swimming pond to be constructed on the shore, adjoining the esplanade at the south beach opposite the Low Green.

Glasgow.—SLUM CLEARANCE.—A further scheme of city improvement in Glasgow, relating to slum clearance and rehousing, has been agreed to by the Corporation Sub-Committee on Insanitary Areas. The Medical Officer of Health submitted a report involving 1,166 houses considered uninhabitable, and these, it was stated, he proposed to include in the next scheme of slum clearance promoted by the Corporation. Of the dwellings referred to, 156 are situated in the central district, 570 in the southern district, and 440 in the eastern district. The sub-committee, after consideration, instructed that a draft scheme be prepared.

Nairn.—HARBOUR.—The Town Council has decided to take preliminary steps to arrange for a loan of £26,000 for the Harbour Improvement scheme.

Turnberry.—EXTENSIONS.—The Count Ayr Licensing Appeal Court has approve proposed extensions to the Turnberry for the L.M. & S. Rly. Plans show extension, to include numerous addi bedrooms and an excellent swimming poo cost of the entire alterations being £60,000. Confirmation was also grant the secretary of the Largs Hills Hotel (Largs, of an inn and hotel licence fo Largs Hill Hotel, Largs. Plans showed it is intended to double the bedroom acco dation of the hotel.

Lennox.—EXTENSION.—The Western trict Committee of Stirling County C have received a letter from the Boa Health approving the proposed erection cubicle pavilion at Lennox Joint Hospital

Galashiels.—HOUSES.—Tenders for 20 h on the Wood-street housing site have bee cepted by the Town Council. Messrs. J. Hall, Ladhope-vale, are the architects.

Dundee.—Plans and sections of the f ing proposed new buildings, etc., have lodged at the Office of the City Engine Byron-street—church and house for the R and Trustees of the Roman Catholic Di of Dundee, Mr. R. Fairlie, architec Ainslie-place, Edinburgh; Clepington-r additions for the North British Linoleum Ltd.; High-street, Lochee—additions fo Right Rev. Bishop Toner and Truste R.C., Messrs. Allan & Friskin, 26, C street, architects.

Glasgow.—HOUSING.—Plans of a new of three-apartment tenement house have submitted by the Director of Housing t Glasgow Corporation.

Contractor's Estate.

Mr. David Stewart Anderson, of Strat Young-street, Craigie, Perth, sole part Messrs. D. S. & J. Anderson, joiners a tractors, Perth, has left the sum of £

*These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployments Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

NEWS ITEMS

Reconstruction of Newhaven Harbour.

The directors of the Southern Railway have authorised, we understand, an expenditure of nearly £100,000 in connection with the reconstruction of the East Pier at Newhaven Harbour, and the work will, it is hoped, be completed in about two years' time. The contract has been let to a British firm.

New London Township.

The building of a new town, to be known as "St. Helier's," at a cost of £1,000,000, on the outskirts of London, will be started in the New Year, says the *Daily Telegraph*. The London County Council are responsible for the scheme which will provide 9,000 houses, with accommodation for about 50,000 people. The new town will be christened St. Helier's as a compliment to Lady St. Helier, who has just retired from the London County Council. It will be in the Merton area, covering 843 acres, and will include parks and open spaces, up-to-date shopping centres, ten elementary schools, and two secondary schools.

Town Planning.

In view of the general importance of town planning, not only to local authorities and their officials, but also to private interests concerned in the development of land, the part of the annual report of the Ministry of Health for 1926-1927, which deals with this subject, has again been published separately. The report contains a statement, not only of the position of town planning schemes throughout the country at the end of the year, and of the progress of regional planning, but also of the attitude of the Ministry on a number of points of general importance which have arisen in connection with town planning, and with appeals relating to proposed developments. Copies of the publication may be purchased, price 6d., directly from the Stationery Office at the following addresses: Adastral House, Kingsway, London, W.C.2; York-street, Manchester; 1, St. Andrew's Crescent, Cardiff; or 120, George-street, Edinburgh; or through any bookseller.

The Factories Bill.

The Home Secretary (Sir William Joynson-Hicks), on October 12, has written a letter to the Association of British Chambers of Commerce, in which he says:—"May I point out that there has been no general factory legislation since 1901, that the last Government but one drafted a Factories Bill, that the last Government drafted another one, and that His Majesty's present Government has for the last three years announced its intention of submitting a Factories Bill for the consideration of the House of Commons? I can only tell you, as the Minister responsible for this legislation, that the Government is satisfied that the time has come for a new Bill, that there are many matters relating to the welfare and well-being of the workers which need consideration, and, while I am anxious to hear, and if possible to meet, the views of the employers throughout the country on matters of detail, I am not prepared to withdraw the Bill altogether."

The Secretary of the Association, replying to the Home Secretary, wrote:—"I am to say that the greatest social service which the Government can render to the community at the present time is to make it possible for industry to absorb the enemployed. Any legislation which adds to the burden on industry makes this increasingly difficult, and must therefore adversely affect the welfare and well-being of the workers, which it is our desire, equally with yours, to conserve and improve."

Sir William Joynson-Hicks began on Monday a series of visits of inspection to Lancashire cotton mills, in connection with proposals which, it is understood, may be embodied in the new Factories Bill, expected to be introduced in the House of Commons during the Autumn Session.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXIII. No. 4426 DECEMBER 2, 1927.

THOMAS ROWLANDSON

THE centenary of this famous artist is celebrated by the unique exhibition which opened at the Tate Gallery on Wednesday. A selection of ninety tinted drawings indicates but a fraction of the vast extent of this 's labours. Professor Tonks classes Rowlandson as the of the modern school of draughtsmanship. Little is n of the details of his career, yet his drawings epitomise tent of his doings. A slight obituary notice states that s the son of a tradesman in the Old Jewry, who sent him ood school in Soho Square. As a mere boy he attended ewly opened Academy Schools, and sat at the feet of olds. From his sixteenth to eighteenth year he was ing in Paris, returning to London in 1772 to continue udies at the Academy.

wlandson's career divides into three periods, *i.e.*, student in London and Paris, the period during which he took up ait painting, and the phase when he was working under mann's instructions. All these periods were connected by of unremitting toil. He travelled through the length and th of England, as well as taking frequent journeys on the nent, drawing anything and everything. Architecture into the gamut of his works, but with the exception of studied interiors, it is mainly shadowy and elusive. His vas to seize upon outstanding features of buildings rather attempt detail. The roads and wayfaring life, scenes at ports, hangings, market fairs and crowded streets, were ief subjects. He could invent a conventional treatment ees and brushwood, hit off the character of a country and depict the rotundity of his time with a few deft s of his broad reed pen. His knowledge of anatomy and uman form was amazing. Living in a Bohemian circle, ing hands with J. R. Smith, Morland, Gillray, friendly Angelo the fencing master, he became the interpreter of ose if fashionable life of the period of the Napoleonic wars. rawings are alive with the comedy of life. The laughter caused at the time, when they were eagerly purchased by ublic, has been echoed for more than a century. Now the is ranked in a higher category than that of a mere carica- he is thought of as the line historian of the period.

m 1775 to 1781 he exhibited portraits at the Academy. follows a break until 1784, when he continued to exhibit 1787. After this his name does not appear in the cata- . As early as 1780, Rowlandson came before the public as a draughtsman-etcher worthy of attention. His , undoubtedly, was recording scenes of social life. His was virile, voluptuous, concise and excellent. It exactly the contrasts between high and low. It was almost us in its brilliant dash and surety. Even the cheap issued at a shilling apiece, avoid the stigma of being too

Perhaps the best of his early works is the studied g of Vauxhall Gardens, coloured prints of which were on ter 1784. Rowlandson, whatever his own shortcomings runkard and a gambler, was consciously sympathetic to aracter of his fellows. He saw life, not through rose- ed spectacles as was the case with Farington, but as one to its distressing contrasts. He rarely caricatured y, neither did he fail to record the charms of pretty n. The ugliness of the worldly is shown in the best of grand caricature. He grades his subjects and allows ne contrasts of prettiness and absurdity, pulling the into unity by the satirical wit of his rolling line. Hogarth similar trick and used it with more serious intent, as d the limner of the first and second of the Hanoverian . Rowlandson in his methods excelled the somewhat works of his French contemporaries, and this he accom- d with a tithe of the labour.

Wherever Rowlandson moved his perceptive eye was noting the attitude of persons under different situations. His drawings pulsate with life. The fine collection of his originals in the possession of Mr. Bridger, of Penzance proves his versatility. Here we become friendly with Cornish boatmen, we visit the Delabole quarries, and inquire into the contrast of natural scenery.

The sketch, in the British Museum, of George Morland in his handsome and debonair years, has a fireplace for a background, which is almost a working detail. His bold flowing penwork traced the contours of buildings, the cauliflower silhouette of trees, and the undulations of the countryside with vehement skill. But he never lost the atmospherics, and he was always an adept at slight picture making. His figure studies of men and animals, of individuals and crowds, have in every case the easy spontaneity which is never absent from drawings made at the moment. His work not only captivated the public, but it inherited the tradition of Hogarth, and in its bright fluent illuminations roused the envy, as it did the praise, of his contemporaries.

It was the gift of quick notation, combined with years of experienced groundwork, that gave Rowlandson the pull over the accomplished members of the Royal Academy. Here was a man who could tackle anything, and bring it down to a few lines on paper. One who could rival Vandervelde in drawing ships, was as gifted as Cipriani or Bartolozzi, was less ponderous than Claude, and as a caricaturist less brutal than Gillray. As Rowlandson's work advanced to the third stage, it began to show new tendencies. All along there had been an admixture of the pretty with the ugly. Now there was to be serious work for Ackermann, as revealed in the series of plates for the Microcosm, with which the elder Pugin was associated. At the same time, the brilliant gaiety which had been such a feature of the work previously exuding from his pen developed into a flashiness bordering on the gross. In extenuation, it should be remembered that the period of the Regency had little in common with the outward refinement associated with the dress and manners of the age previous to it. Rowlandson was now advancing in years, his technique was as brilliant as ever, but he had lost the fire of youth, and had passed the youth of old age.

His industry from first to last was literally enormous. He was familiar with the interiors of fashionable clubs, at home in the Pump Room at Bath, equally delighted with tavern life, and he could execute the incidents for the imaginary tour of Dr. Syntax. Rowlandson's fame as a natural artist does not rest upon his capacity for work, nor his skill in suiting the public taste. On the contrary, it lies in his mastery of line, his appreciation for tremulous activity, no less than his conquest of anatomy and perspective. Sufficient is it to say that his equal has, perhaps, never been found, and that the modern school which appears to think it has solved the problem of the fourth dimension in art, has still to retrace its impetuous steps.

Architecture in the past owed much to the ability of the old architects as draughtsmen. Inigo Jones and his long line of successors, were able to reduce their ideas to direct statements of line. The study of the figure, no less than the study of scenery, was part of their mental equipment. Some of the perspectives which annually secure a place on the line at the Royal Academy, are as far removed from real art as chalk is from cheese. Successful architects will say that they have no time to make pictures. Yet the scantiest representation possessing the fire of imagination is far worthier of esteem as a work of art than much that has taken its place. Every architectural student should pay a visit to the Tate Gallery and see for himself what the work of Rowlandson means.

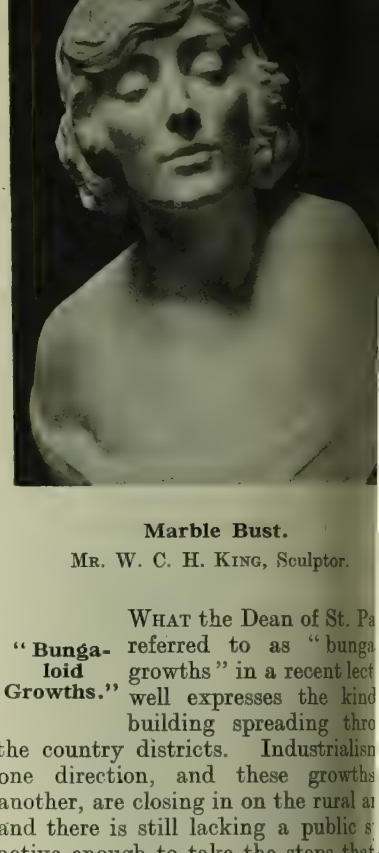
NOTES

Manchester Competitions.

IN our issue of November 18, we made some reference to the competition for the extension to the Municipal College of Technology, Manchester, and to recent Municipal competitions in Manchester in general, and to the fact that some of our leading architects appear to think it would be a waste of time to take part in the competition for the proposed extension to the College of Technology unless they have some definite assurance that the work is really to be carried out, and that the efforts of some one of those competing will not be thrown away. While we are not in a position to make any definite or official statement, we are glad to inform our readers that so far as this competition is concerned, there is every reason to believe that the building will be proceeded with in the immediate future and, from information we have received, we do not think competitors need hesitate to enter for the competition. The building is to cost, in the first instance, we understand, £170,000, and a good deal more at an early date, from which it will be realised that the competition is an important one which should interest some of our best architects

The R.I.B.A. Street Architecture Medal.

PERHAPS if the choice of a building to which is to be awarded a medal were to depend on the number of votes secured there would be more interest felt in the matter. The jury which decides this matter has amongst its members those whose opinions would be respected, but these particular members might be incapacitated through some reason or other and then perhaps voting by numbers would be preferable. However, it may be hoped that a little more interest may be shown by a much larger number of votes, and it is definitely stated that one may vote for one's own building!



The League of Nations Designs.

THERE will hardly be very wide appreciation of the British designs submitted for the League of Nations buildings exhibited at the Institute Galleries, though one of the designs appears to reach somewhere near the expression one would expect in buildings devoted to the high purpose and dignity of the League. In such a project as this it is much easier to arrive at an orderly and convenient lay-out of plan than to obtain the design for a structure of fine distinction and dignity to erect upon it. For a subject of this kind it is probable that the best students of the School at Rome would be more likely to achieve success than most of our practising architects. Messrs. Milburn, of Sunderland, in their design have achieved something of the dignified simplicity and breadth which such a subject seems to call for, though in the absence of a bird's-eye view their main elevation fails to give quite a true impression of the group as the higher buildings at the back have therein more than their relative value. The application of columns has a distinct value. The antithesis of effect is to be found in the design of Messrs. Kieffer and Fleming, which shows some dignity of handling with square solids and voids, but rather lacking in the grace of expression or beauty of detail. The clever plan by Mr. James Burford showing a central circular hall and all the other buildings radiating from it, the cathedral-like effect of the group designed by Messrs. Carus-Wilson and Mears, and some good features in the design by Mr. Alex. N. Paterson, call for some appreciative note, but we are bound to confess that if what is shown at the Institute is the best which this country contributed, it is rather disappointing.

"Bungaloid Growths."

WHAT the Dean of St. Pa referred to as "bunga growths" in a recent lect well expresses the kind building spreading thro the country districts. Industrialisn one direction, and these growths another, are closing in on the rural a and there is still lacking a public s active enough to take the steps that possible to diminish the evil. The plenty of complaint, no doubt, inhabitants of country districts— have seen the disfigurements wrough recent years, but little effort is mad them to help themselves. It is not a unusual to be told that a meeting been held in one locality or anothe the Town Planning Institute, but nothing has been done! There mus public spirit in the locality as well, complaint is rather against those wh not take action when help towards given by the Institute. The bungalo shack type of construction, dum down anywhere and without consi tion of the neighbourhood it disfig will only be prevented when the pub conjunction with the Institute's take the matter into their own h but they must not expect to have done for them.

The Example of Oxford.

THE purchase of Boar's through the Oxford servation Trust and tracts of land recentl quired is an example possibilities for improvement where is corporate action taken, and a spirit to support it. This good ex might well be followed elsewhere. It only in Oxford that there are hist and architectural associations imp through the want of local action to them. Oxford has suffered through the unregulated multiplic mean buildings in its neighbou one, not the least of these, bei

pproach from the station, dis-
y advertisement hoardings and
ightlinesses. John Masefield, in a
cation on this subject to a con-
y, describes how that "the
aving made the city impossible,
the country without adding
fe of the country side." It is,

yet rival the ecclesiastical buildings of the Middle Ages, were the strength of youthful talent—and there was never more—expended on them. For it is opportunity works the miracle, and we can only know by example what such an impulse can reveal. We much hope, therefore, that Sir Joseph Duveen's fine example will be followed elsewhere and the art of mural decoration receive the popular impulse for which it has long waited.

Shopfronts and their Treatment.

THE November-December issue of *Architecture*, devoted to the shopfront, is now on sale. A number of very recent efforts are included in the selection made—one of which is reproduced on page 865—while there are given examples of most kinds of shop. Mr. Arthur J. Davis's R.I.B.A. lecture on "Shopfronts and their Treatment"—a most comprehensive study of the subject—is included in an issue which also contains some of its usual architectural features.

Children and Architecture.

WE are glad to note that the Council of the Royal Institute of British Architects are arranging a series of lantern shows on architecture for children during the Christmas holidays. This is a very good move—unless it should create an extended desire to become an architect!

Needlework Exhibition.

THERE is quite a wonderful show of needlework by Miss E. Rawson Constable at the Walker Galleries in Bond Street, and the collection speaks volumes as to the industry and artistry of the lady. The large wool landscape of trees and castle (No. 22) is an admirable decorative panel in low tone of colour, and shows how real may be the value of the stitches in the texture and tone. The little landscape of Harlech Castle (No. 28) is another graphic illustration of the real value of light and tone, which needlework can achieve. The view from the Star and Garter is another noticeable piece. The wool landscape (21) is a fine vigorous piece. The little view from Algiers (62) is a charming little picture, and one wonders at the moderation of its price.

Waste Paper.

ON Monday, Professor C. H. Reilly, F.R.I.B.A., gave an interesting and amusing account of the recent Architectural Association tour to Czecho-Slovakia and Vienna. Several of his remarks, in spite of possible humorous exaggerations, did not lose their point. He described how, in Vienna, the streets were clean and tidy, and is reported to have said that if one only dropped a tram-ticket, a policeman came along with a bared sword and fined one 2s. on the spot. This procedure—whilst at first sight appearing somewhat drastic—is one that might be copied in this country with modifications. The amount expended by municipal authorities annually upon scavenging must reach a large figure and one that might be much reduced were the public only more careful and thoughtful as to the way in which they dispose of their rubbish. At the same time, however, it must be admitted in fairness that the provision of receptacles for rubbish is very poor. The matter is one for concerted action on the part of both the public and the municipal authorities.

Plaster Sketch Model for Bronze Eagle.
MR. W. C. H. KING, Carver.

GENERAL NEWS

Professional Announcement.

Mr. James Chapman, M.I.Struct.E., has removed to 435, Mansion House Chambers, London, E.C. 4. Telephone : City 7092.

A Surveyor's Estate

Mr. Morgan Young, of Broadhurst-gardens, West Hampstead, and Southampton-street, Bloomsbury, surveyor; left £31,457 (net personalty £30,432).

Browning Hall, Walworth.

Browning Hall, Walworth, built in 1789, has been condemned as a dangerous structure. The customary notice has been served by the London County Council on the Warden (the Rev. J. W. Graves). The reason given is that the main wall on the east side has a serious bulge. Browning Hall was first used as an Independent or Congregational chapel, being known as York-street Chapel.

Honour for Contractor.

Among the names of the eighteen new Justices of the County of Devon appears that of Mr. G. K. Blatchford, who is the chairman of the directors of Messrs. Blatchford, Ash & Co., Ltd., builders and contractors. Mr. Blatchford has taken an active part in the public life of the district for many years. He was Mayor of Okehampton for three years (1923-1926) and is serving his third term of office as county councillor.

New Thames Bridge at Marlow.

Marlow is to lose the iron suspension bridge which connects Buckinghamshire and Berkshire, for, according to the *Daily Telegraph*, it has been declared inadequate to support present-day road traffic. The bridge, which was erected about 100 years ago, is to be demolished, and a new ferro-concrete bridge, faced with stone, is to be built in its place. The new bridge will have a single span, and it is estimated that the scheme for the demolition of the old bridge, and the construction of the new—which will take two years—will cost £70,000.

Incorporated Church Building Society.

At the meeting of the Incorporated Church Building Society held at 7, Queen Anne's-gate, Westminster, on Thursday, the 17th ult., the Hon. Sir E. P. Thesiger, K.C.B., in the chair, grants were made towards building new churches at :—Clipstone, All Saints, £200; Grimscar, St. Cuthbert, £450; Newbridge, St. Paul, £150; Wallasey, St. Thomas, £150.

Towards rebuilding the church at Swalwell, Holy Trinity, £150.

Towards enlarging or repairing the churches at :—Ashcombe, £25; Ashford, St. Hilda, £100; Barking-cum-Darmsden, St. Mary, £50; Bottisham, Holy Trinity, £30; Chellaston, St. Peter, £50; Eardisland, St. Mary the Virgin, £25; Llanbadarn-y-Garreg, St. Padarn, £30; Llangurig, St. Curig, £15; Molesey, East, St. Paul, £50; Newington, St. Nicholas, £20; Offham, St. Michael, £20; Ogwell, West, £40; Presteigne, St. Andrew, £50; Stamford, St. George, £40; Watford, St. James, £75; Wennington, SS. Mary and Peter, £30; Winscombe, St. James the Great, £50; Wolvercote, St. Peter, £30.

The following grants were also paid for work completed at :—Arnesby, St. Peter, £25; Ashby, St. Paul (Bal.), £75; Becontree, St. Thomas, £400; Bradoc, St. Mary, £25; Buckshead, £5; Cookham, Holy Trinity, £50; Crosby, St. George (Bal.), £75; Deptford, St. Luke, £70; Fairbourne, St. Cynon, £175; Ipswich, St. Helen, £25; Newton, St. Botolph, £20; Ryhope, St. Paul, £125; Stevenage, St. Nicholas, £100; Teignmouth, East, St. Michael, £30; Tey, Little, St. James, £20; Walworth, St. Peter, £100; Wimbledon, St. Matthew, £200; Wylde Green, Emmanuel, £200.

In addition to the above the sum of £2,314 was paid towards repairs to 41 churches from trust funds held by the Society.

OBITUARY

Mr. H. A. Grueber.

We record with regret the death of Mr. Herbert Appold Grueber, F.S.A., late Keeper of the Department of Coins and Medals at the British Museum, at Bembridge, Isle of Wight, in his 82nd year.

Mr. R. W. Gibson.

Mr. Robert Williams Gibson has died recently at his home on Long Island, New York, at the age of 73. A distinguished architect who had been an American citizen for 40 years, he was born at Aveley, in Essex, on November 17, 1854. Entering the architectural school of the Royal Academy in 1875, he won medals and was awarded a travelling scholarship in 1878. With this he travelled in Spain, France, and Italy, and in 1881 he went to Albany, U.S.A., where he was successful in a competition with his design for the Protestant Episcopal Cathedral. Success with a design for the Commercial Bank led him to make a special study of bank buildings. Among many other buildings designed by him in New York may be mentioned the Clearing House, the Botanical Museum, the Coffee Exchange, and St. Michael's Church.

Mr. John Muirhead.

We regret to record the death of Mr. John Muirhead, R.S.W., R.B.A., well known as a landscape painter in oil and water-colour. Born in Edinburgh in 1863, the son of John Muirhead, an architect, he was educated at the Edinburgh High School, and began his art studies at the Board of Manufacturers' School. He exhibited his first pictures in 1881 at the Royal Scottish Academy, and since then his work has been seen at the Royal Academy, the Royal Institute, and in various exhibitions at home and abroad. He was elected to the Royal Scottish Water-Colour Society in 1893, and to the Royal Society of British Artists in 1902, and served on the council of each. He was also vice-president of the Croydon and of the Hampshire Art Societies, and chairman of the art executive of the Three Arts Club.

MEETINGS

SATURDAY, *December* 3.

London Association of Builders' Foremen and Clerks of Works.—Annual dinner. Hotel Cecil. 6.30 p.m.

Institution of Civil Engineers.—Visit to the works for the new offices of the London Electric Railways at St. James's Park Station, S.W.1.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Preservation of St. Paul's Cathedral.

SIR,—In reply to your invitation to answer in *The Builder* the remarks of "Inquisitive" concerning my book, "The Preservation of St. Paul's Cathedral," I cannot help feeling that you must be mistaken in describing him as "an architect of standing, who has made the subject of ecclesiastical architecture a life-long study." Surely an architect of standing would be man enough to sign his name, and a student of church architecture would be capable of comprehending a geometrical diagram.

I recognise "Inquisitive" by certain infallible signs, such as his tendency to root out isolated sentences from a book instead of reading it as a whole, and by his stupid love of destruction. How much attention his frothings deserve may be indicated by a single quotation: "The Whispering Gallery is a balcony, and a projecting feature which incidentally strengthens the wall, and therefore cannot really be described as 'standing out several feet over the internal space.'" Why not? Is it not the function of a projecting feature to project, and of a balcony to stand out over a space? But it is wonderful that "Inquisitive" can put words together at all; we must not expect him to understand their meaning. That he is unable to recognise negative from positive is seen again when he whips himself to fury over my alleged disrespect for Sir Christopher Wren! But is it more honouring to Wren to inquire diligently into the needs of his building, as I have done, with the object of preserving his veritable inventions by first discovering and then by supplying the structural deficiencies noticeable after two centuries, or to leave his wonderful dome so ill repaired and so ill supported that it will need to be demolished?

It was this proposal in the St. Paul's Commission's Second Interim Report which made me realise that a vigorous public protest would be necessary, though, sir, as you must remember, my writings on the subject had appeared from time to time in *The Builder*, and had been discussed in a friendly spirit with the surveyor to the fabric. It was not until Mr. Mervyn Macartney's signature appeared at the foot of the inadequate and dangerous patching and grouting scheme that I suspected for a moment that modern principles and practices of scientific analysis and repair would be disregarded or overruled by considerations of immediate expediency, such as the execution of repairs "without serious disturbance to the services."

As the mild language of friendship had proved powerless, it became necessary to apply the goad of more resolute speech, and to show up a feeble, unscientific, and dangerous scheme for what it was worth. "Inquisitive" asks: "Is Mr. Harvey a competent critic?" "Does he know everything about St. Paul's Cathedral or its design?" "What is the nature of his comprehensive scheme of conservation?" Now whether I am a competent critic is a question that does not depend upon my *ipse dixit* for an affirmative answer as "Inquisitive" suggests. The custodians of St. Paul's have added to their original patching scheme several features of which I foretold the necessity, as a comparison of the Second Interim Report with the recently published Fifth Progress Report will show (see *The Builder*, November 18. The "Second Interim" and "Final" Reports are reproduced in my book.) The use of reinforcement, for example, was not so much as mentioned in the original scheme. Well, unless these additions are mere frivolous waste of money—and the worst enemy of the Dean and Chapter would hardly venture to suggest that—they are the strongest practical indication that the man was not far wrong who showed, three years ago, that they were wanted.

In reply to the second of these questions, I ask in turn, "Did the St. Paul's Commission?" It is unnecessary to ask, "Does 'Inquisitive'?" The nature of my comprehensive scheme, its purpose and confessed preliminary character, are all explained in my book, where men of sense and goodwill may read. The value of some of my proposed devices is indicated practically in the model illustrated on pages 114 and 115, and the suggestion is made that the National Physical Laboratory at Teddington should be consulted in regard to further, more detailed, investigations with models. In the meantime, students of arch and buttress construction should make models for themselves, if they want to get the utmost value out of my book, see what I am driving at, or understand how the work now proceeding at St. Paul's resembles, or differs from, my suggestions.

"Inquisitive" cannot make head nor tail of one of my diagrams, and thinks that "It does not appear to correspond with other sections." But as he cannot read plain English, and has to ask where the particular section occurs, though this is stated under the figure, his criticism is simply an admission of ignorance.

His further questions concerning detailed dimensions and calculations should be addressed to the custodians of St. Paul's, who are now undertaking an accurate survey nearly three years after I insisted upon the imperative necessity of it as the basis of certain analysis and calculated repair, and gave detailed instructions how to set about it. Better late than never, perhaps, but that it is still unfinished, nearly six years after the appointment of the St. Paul's Commission, is a strong indication of the need of critical interest from outside the walls of the Cathedral.

"Inquisitive" gets the cart before the horse once again in his statement that my proposed measures would "pare off the 32 counterforts of the dome." Against the Commission's statement that "these buttresses do not play an important part in transmitting weight to the bastions, nor, in your Commission's judgment, is it desirable that they should," I entered a vigorous protest on page 143, and the importance of strengthening and rendering these 32 counterforts effective is insisted upon in other pages, as the index directs. . . . What a critic!

To set against the minor temporary adjustments that have to be made in the insertion of any comprehensive scheme of repair, and about which "Inquisitive" makes so many fantastical misstatements, it must be remembered that successive custodians have permanently altered stairs and passages for convenience at their own discretion, and that the patching and grouting scheme of the St. Paul's Commission was saddled with the threatened demolition of the whole dome!

WILLIAM HARVEY.

A Defence of Quantity Surveyors.

SIR,—With reference to your comments on Messrs. Nicholson's book (p. 805, November 25), there is a very great deal to be said on the other side. If the quantities are taken out in the architect's office, by a properly trained assistant of course, all difficulties of construction must be met and cleared up while the drawings are at an early stage, and, for his own sake, the architect roughs out a good many half-inch details obviating the cropping up of problems later. There is much less chance of conflict between drawings and the various documents and there is someone in thorough touch with them all. I am certain the practice tends to greater economy, as alternative solutions can be discussed and settled right away.

I have no bias against quantity surveyors. My experience of them has been happy; but any compulsory restriction is to be deprecated. A properly qualified man, perh member, by examination, of the Surv Institution, should not be debarred fro ercising his skill because he happens t practising architect or an architect's ass

I think builders' federations are enough to refuse to tender on the leger but perhaps fictional, documents q "one staircase complete." Nor are confined to quantities prepared in arch offices.

NORTHERN FELLO

Art and the Architect.

SIR,—While architects are strenuously their level best to combat the present ing shortage, one hears on all sides dispa remarks about the plainness of their Most people do not realise that utility is the main theme, and not æsthetic d although, of course, down the ages, arch have been and are excellent artists. sketch books of V. De Honne Brunelleschi, Bernini, Inigo Jones, H moor, Wren, Gibbs, and Soane will prove that many of these men could excelled as artists only.

CHARLES MATTIN

Death-Watch Beetle.

SIR,—With regard to the correspondenc *The Builder* on the depredations of death-watch beetle in pine, I have rec been investigating a case of an ordinary floor, about 40 years old, which has attacked by this pest. I found that boards affected were those containing wood and that others free from sap scarcely touched, even though they can tween the sappy boards. One board w waney edge was so badly eaten that it way under a footstep, thus calling att to the damage that had been going o suspected in the floor. This expe corroborates the statement in the pan referred to by Mr. Max Clarke.

HERBERT KENCHINGT

Answers to Questions in Competitio

SIR,—The correspondence which you published with reference to a recent petition shows the need to emphasise, general way, the suggestion that compe questions deserve more serious conside than is often given to them in archite competitions. This is undoubtedly the ing amongst a number of architects engage in competitive work. Beside correspondence referred to, the matte mentioned, indirectly, in an article in *Builder* a few weeks ago, and is wort the attention of the Competitions Com of the Institute.

After carefully drafting conditions, it be boring to answer numbers of simple tions, but as these answers become, in so many additional conditions, they sho as helpful and clear as the general clau the conditions issued. In view of the im total of labour involved, in even a smal petition, surely no pains should be spa avoid any possible misunderstanding part of the most inexperienced compet

ddle Ages, the man who did the
job existed, and his identity could
ncealed any longer. But he was
r called an *architect*. The most
itle was simply "Master," not
master-mason, and it might be used in its English or its Latin form in England, just as we found it in French, Spanish, Italian, or German abroad.

Dwelling-houses in the Middle Ages were almost negligible as architecture, and churches and castles—the only buildings of importance—were more than three-quarters masonry. The carpenter and the plumber and the glazier were really only accessories, as a rule, so that the directing person on any large building would have to be, above all, a master of mason-craft. He might also have instructed the master-carpenter about the design of the roof-trusses, or he may have confided that to him as a modern architect might hand over certain details to an assistant. But it did not follow that, because the "Master" served an apprenticeship at the bench, he had no other training. We had evidence to the contrary. In the State Library in Paris there was an architect's sketchbook of the thirteenth century, which showed us that one particular man, Villard de Honnecourt, went on sketching tours, picking up ideas all over Europe for his own buildings, that he could draw plans and details, and that he was not only an expert draughtsman, but that he had a good knowledge of construction and geometry.

The number of old architects' working drawing which had survived was certainly not large, but there was a reason for that. In those days parchment was scarce, so that when a drawing had been used, unless of course it was worn to rags—as would usually happen then as now—the ink was carefully rubbed or washed out and the parchment was used again, perhaps for an illuminated manuscript. Examples of this treatment had been preserved.

Another reason why so few drawings survived was because plans were regarded simply as a means to an end, not as beautiful things in themselves, and would be destroyed when they had served their purpose. The idea of elaborate framed perspectives for the Royal Academy or to hang on the architect's office wall had not occurred to the medieval mind. But we *did* know of sufficient surviving drawings to be quite sure that the medieval architect was a competent draughtsman. He used compasses and ruling pens, a rather thin line and ink that was, at any rate, rather grey or brown in colour, and if the drawing was a large one he had to stick two or three skins of parchment together.

There was an enormous elevation 10 ft. high, to a scale between 4 and 5 ft. to an inch, of one of the towers of Cologne Cathedral, of which a facsimile was in the Library of the R.I.B.A.; and quite a number of others in different parts of Europe, including England. The most interesting that he had ever seen was a whole set in the Cathedral Museum at Siena, in Italy. These included a competition design, made in the year 1339, for the tower or campanile of the cathedral. It was 7 ft. high and about a foot wide, to about ¼ in. scale, drawn in brown ink, with instruments in strict orthographic projection, and carefully coloured to show the actual tints of the variegated marble facing. It was a highly finished detail drawing, quite modern in type.

Now, as it could be proved that medieval architects could draw, could not we, as practical men, go a step further, and say that anybody who would try to erect an elaborate building without a plan would be simply a fool? Try to build even a subsidy cottage without a plan, and one could see what a muddle one got into over the staircase and roof. If we admitted this, we might conclude that somebody prepared plans for every medieval building of importance, and that somebody must have been the man who was really responsible for the design. That somebody, "the architect," generally worked continuously on one job at a time, like a clerk-of-works, and had his "office" on the job. Without roads or railways or telephones, obviously he could not tear about all over England. But he did not always confine his attention to one building: he undertook consulting work elsewhere sometimes, and occasionally he ran several jobs at one time, like a modern practitioner. When he had finished, say, a cathedral or even while he was still busy on it, another cathedral chapter might bid for his services. He was quite an important person, and we often found that the "Master" was given fur robes of esquire's degree, and a good place in society.

In the Middle Ages, because dwelling-houses and shops and inns were mere sheds, building consisted mainly of castles for the king and his noblemen, cathedrals, monasteries, and parish churches. The employer was therefore either the king, or a great nobleman, or a cleric, and he employed a steward or controller or treasurer, who bought most of the material and paid the workmen through their respective masters—the master-mason, the master-carpenter, the master-smith, and so on. William of Wykeham, often described as the first great English architect, seemed to have been an official of that kind, not an architect at all. Besides the controller, there was often a clerk of the works, and Geoffrey Chaucer once occupied that position, though rather as an amateur, he (the speaker) thought.

The man whom we should now call the architect was sometimes independent of the master-mason and above him; sometimes he combined both functions, and in that case he had to buy some of the material and pay all the other masons their wages.

He (the speaker) believed that the design of buildings could not have been done by a guild, as was sometimes stated. Men were human beings in those days as now, and somebody must always have made the design, and somebody else must have directed the building operations in general. (No committee could have designed a cathedral.) So where one man did both the designing and superintending, no matter whether he started life as a mason or whether he undertook only one building at a time, he (the speaker) maintained that we might call him the architect.

The lecturer, in the concluding part of his paper, referred to the architects of the Renaissance and later periods.

Following the reading of the paper there was a brisk discussion, in which the Chairman, Mr. Hugh Davies, Mr. Jarman, and a number of other speakers took part, and the lecturer subsequently answered a large number of questions.

Following are notes from the Minutes of the Council meeting on November 7 :—

Presentation of Drawings to the R.I.B.A.—The Council passed a cordial vote of thanks to Mr. Sigismund Goetze for his kindness in presenting a selection of drawings and sketches by Alfred Stevens to the Institute.

International Congress at Amsterdam.—A report was received from Lt.-Col. H. P. Cart de Lafontaine, A.R.I.B.A., the R.I.B.A. delegate at the recent International Congress of Architects held at Amsterdam. The hearty thanks of the Council were conveyed to Lt.-Col. Cart de Lafontaine.

The Fellowship.—The Council, by a unanimous vote, elected Mr. G. de C. Fraser, of Liverpool, to the Fellowship under the powers defined in the Supplemental Charter of 1925.

R.I.B.A.: Christmas Holiday Lectures on Architecture for Children.

The Council of the R.I.B.A. are arranging a series of lantern shows on architecture for children during the Christmas holidays. Detailed particulars of the scheme will be published at an early date.

L

THE ARCHITECTURAL ASSOCIATION

Mr. GILBERT H. JENKINS (President) occupied the chair at the meeting of the Architectural Association on Monday evening, when PROFESSOR C. H. REILLY, F.R.I.B.A., gave an account of the recent A.A. tour to Prague, Vienna, and Salzburg.

New Members.

At the opening of the meeting, the PRESIDENT announced that there were 13 nominations for membership, and the following were elected members :—

Mr. A. D. Gamble.
Mr. D. L. Milner.
Mr. O. Vaughan.
Mr. R. G. M. Chase.
Mr. R. C. Tuely.
Mr. W. R. Wooding.
Mr. K. K. Tan
Miss Z. T. Maw.
Mr. M. A. S. Dugdale.
Mr. K. F. L. Farnfield.
Mr. E. C. Kent.
Mr. W. J. R. Penrose-Thackwell
Mr. D. Murchland.
Mr. T. W. Barton.
Mr. G. V. Bird.
Miss F. M. C. Raymond.
Mr. B. P. Westwood.
Mr. M. T. Sein.
Mr. G. W. Nelson.
Mr. V. Harding.
Mr. J. P. Darby.
Mr. J. L. Merry.
Mr. W. R. Hutcheson.
Miss M. L. Atkins.
Miss A. M. Robertson.
Mr. G. A. Butling.
Mr. E. Garthside.
Mr. E. Mayorcas.
Miss A. R. Gascoigne.
Mr. H. C. Boardman.
Mr. E. A. Grove.
Miss P. D. Jackson.
Miss R. E. Benjamin.
Mr. B. A. Hebeler.
Mr. P. R. Pulham.
Mr. W. W. Kenyon
Mr. R. T. F. Skinner.
Mr. W. Wolkoff
Mr. W. J. McGrenera.
Mr. J. P. MacCann.
Mr. W. A. Dorey.
Mr. C. J. Searle
Mr. J. B. Brandt.
Mr. H. S. Luke.
Mr. S. C. G. Lambert.
Mr. R. A. C. Simpson.
Mr. M. Aya.
Mr. L. A. Drake.
Mr. R. F. Henniker.
Mr. R. Bruce.
Mr. M. W. Haigh.
Mr. E. W. N. Mallows.
Mr. J. W. Hoare.
Mr. A. V. Foley.
Mr. S. G. R. Marsh.
Mr. J. F. D. Wylson.
Mr. A. I. K. Sinclair.
Mr. T. W. Marwick.
Mr. M. R. Hofler.
Mr. M. J. Hamilton.

The A.A. Excursion.

PROFESSOR REILLY then gave an interesting, and frequently amusing, account of the excursion, illustrated with many lantern slides of the more interesting places and buildings visited by the party.

After describing the adventures of the party on the way to Czecho-Slovakia, he dealt with Prague and its buildings. On arrival here, as elsewhere, the party was met and welcomed by a deputation of leading architects of the city; in some cases they were accorded an official welcome by the municipality. The day after their arrival they visited the older part of the city, which contained many gorgeous mediæval and Baroque buildings, overlooked by surrounding hills. A fine wide river flowed through the town, crossed by a magnificent series of bridges, including a beautiful mediæval bridge with a great tower at each end and with thirteen great cutwaters; each of the piers contained a magnificent group of Baroque figures; altogether it was a most romantic bridge. Most of the old buildings in the town were very fine, but he was not much impressed with the modern buildings.

On the following day they visited the Prague Town Hall, and were shown the town-planning scheme for the city. At present Prague had 800,000 inhabitants, but in the town-planning scheme they were looking ahead to the time when the population would be 2,000,000 and had already arranged where all the people were to live in ten years' time.

At Vienna they first saw the famous Ring, which he considered to be more metropolitan than anything he had seen. It was formed about 1860 (not a really good architectural period), but it had a fine air of spaciousness and dignity. Although Vienna was a poor city, it contrived to keep up appearances very well; the streets were clean and tidy, and drastic steps were taken to keep them in that state. All the public buildings were set in fine open spaces. He thought they were all impressed with the intimate way in which they had become familiar with Vienna through the Rickards drawings. After seeing the seventeenth- and eighteenth-century Baroque work, they passed on to the modern post-war building schemes, which were particularly exciting after the older work. It was interesting to note that these houses had not been built on any loan or subsidy system, but the cost had been raised by direct taxation, with the result that there were no sinking funds or capital charges, and a small flat could be rented for 4s. 9d. a month. These flats were built to an extraordinary scale, in large blocks many stories high, each of which seemed bigger and finer than the Adelphi Hotel at Liverpool. Generally the flats were covered with stucco, while the ground floors were often treated by hammer-dressing the surface of the concrete, which gave it a fine, strong, monolithic appearance. Some of the blocks were built on sloping sites, so that there were terraces and set-backs. In all the courtyards a well-placed statue was to be found. All the houses were clean and tidy. The grass grew untouched; in many places flowers grew in public spaces untouched, which was an inconceivable state of affairs in England. The top floors of the blocks were often occupied by laundries and public rooms. The architects had produced remarkable results, in spite of the difficulties they had to contend with; all the windows, for instance, were double, owing to the coldness of the climate in the winter. The buildings had little decoration or ornament, but what decoration there was had a very charming effect. The selection of the architects for the housing schemes was of interest, for they were all chosen by one elderly gentleman who had served the Government before the revolution as a director of opera houses. When the Labour Government came into power he was retained as a kind of art adviser to the Burgomaster, and it was he who advised which architects should be employed. It was a responsible position, which gave him great power; fortunately he was a man of good taste, and the result seemed quite satisfactory. In Vienna the architects were paid a fee of 2½ per cent. on housing work, the building being carried out by direct labour under the direction of an architectural engineer.

Of particular interest in Vienna was a technical school to accommodate 6,000 students, partly a hostel where some of the students lived and partly an ordinary technical school. It was on a scale to which we were not accustomed in this country. In the courtyard was the usual single piece of sculpture, on a hammered concrete base which every one of the party mistook for granite until they made a close inspection. The hammer-dressing of concrete seemed a very fine method of expressing the material, and gave it a fine monolithic appearance. The whole of the building was in concrete, and in the interior no attempt had been made to hide the beams or to give them any expression other than they got from their constructional forms. There was also in Vienna an institute where derelict children were collected by the municipality. There was a law in the city under which every house was inspected, and if the inspectors were of the opinion that the children were not being properly cared for they were taken away and kept at this institute before being passed on to learn a trade.

They found Salzburg a delightful town, with a great castle on a hill, a fine river, a few palaces, a Reinhardt theatre, and good churches. The whole town was on a noble scale, although it was quite small.

Throughout the lecture Professor Reilly paid many tributes to the excellent manner in which the excursion, down to the smallest detail, had been arranged by Mr. Yerbury.

Discussion.

Mr. W. H. ANSELL proposed a vote of thanks to the lecturer, who, he said, they honoured for the great work he had done at Liverpool. Professor Reilly had cast a glamour even over smoky Liverpool. He (the speaker) felt that the architects of the new Vienna housing schemes, with their loggias and statues, thoroughly enjoyed themselves. They were not bored by the[i]r and the result did not bore those who buildings. Too often English architec bored with their work, and the res that they bored everyone who saw it. was a real lesson to be learned f[r] modern Viennese work and also f[r] Baroque, which was so full of life.

Mr. AUMONIER said from the carver of view he thought the work they h abroad was essentially individual; it appearance of being the work of an dual craftsman and not of a firm placing of the decoration and the disposition of the buildings in seemed exactly right. The buildin not over-elaborated, but the ornam always good; it seemed, indeed, tha too good to have been done by an a and that it might have been design sculptor as a background for his They had seen some of the interes amples of concrete sculpture, which to have considerable possibilities f[r] craftsman's point of view.

Mr. STANLEY HAMP said in the work they had seen there was a d freshness and appreciation of decorati that he would like to see more used country.

THE BEAUTY OF T LAKES

MR. E. GUY DAWBER, A.R.A., PP.I a vice-president of the C.P.R.E., dressed a letter on this subject to th Referring to the urgent need of steps to prevent the destruction beauty by the use of unsuitable materials, especially in the roofs houses, he says :—"The position absurd were it not so deplorable; f Kent, Surrey and Sussex, where is warm in colour, are suffering fro[m] flux of blue and grey slate from th Westmorland and Cumberland have put up with the advent of glaring from the South—materials in both tirely at variance with the traditio acter of the buildings of those count green slate of Cumberland and Wes is one of the best roofing materials tence, harmonising beautifully with walls and the characteristic greyne country.

"If only the people of these distri realise the infinite harm that is b[e]ing to the beauty of their countrysid judicious building they would surel[y] prevent its continuance. A town scheme is in process of being carried and, in amalgamation with the local authorities, the district will b[e] by a regional plan. At present thes[e] ties have no control over the des[i]gn ever bad, or the materials, howeve[r] able, of any new buildings, but u[n]der Town Planning Acts they can adopt clause prepared by the Ministry [of] giving them this power, and can make this operative from the time up the scheme. If the local auth the Lake District coming under thi plan will agree to adopt the clause [to] the erection of buildings out of with their surroundings, the mo would be great, and would do much what is nothing short of a disaster.

British Museum Appointmen

Amongst the appointments mad Principal Trustees of the British are :—Mr. Reginald Allender Sm Keeper of British and Mediæval A[n]t in succession to Mr. O. M. Dalton tires in December. Mr. Edgar J dyke to be a Deputy Keeper in t[he] ments of Antiquities, in successi[on] R. A. Smith.

ACOUSTIC DESIGN

R. Watson, of the University of
n an address on this subject given
6, in Chicago, at a meeting of the
Bureaux of Architecture and the
on Church Building of the Home
Council, said the acoustic adjust-
ooms was a subject of modern de-
, and became an acute problem
e auditoriums were built with steel
r constructions. As a result, only a
itects were informed concerning
progress in the subject. Active pro-
he acoustic adjustment of rooms had
ulated by commercial companies,
developed various products that had
nerit in greater or less degree. What
ed for ideal acoustics was that the
aching an auditor in any part of a

ech sound, such as any one of the
ttered by a speaker, required about

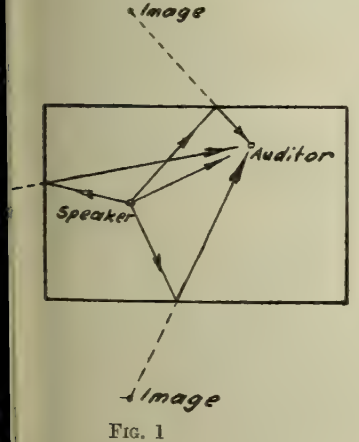

Fig. 1

h of a second for its completion, and
l 112 ft. before the word was finished;
heant, in the open air, that a speaker
e at the centre of a sphere of 112 ft.
hat would be filled with the sound of the word. In an auditorium the sound waves would be reflected several times in travelling 112 ft., so that, instead of a sphere, there would be overlapping bundles travelling in every direction, that completely filled the room with the sound of the word before the speaker finished saying it.

These overlapping sounds might produce confusion. For instance, sound was reflected from the wall behind the speaker in much the same way that light was reflected from a mirror—that was, the speaker had a fictitious image behind the reflecting wall that imitated his speaking. It was then the same as if two speakers said the same words at the same time. Imagine the effect on an auditor. If the two speakers were close together, the effect was beneficial; but if far apart — as would be the case if the speaker were some distance in front of the reflecting surface—a blurring of speech sounds occurred, and it became difficult to understand. Not only was sound reflected from the wall behind the speaker, but from all the other walls, so that an auditor listened not only to the real speaker but to a large number of fictitious speakers, due to the reflecting walls. The possibilities of confusion were easily imagined. (See Fig. 1.)

Modern investigation showed that walls at a distance of about 25 ft. or less from a speaker produced beneficial reflection of speech sounds. This showed the importance of having a speaker located near reflecting walls. Walls more than 25 ft. distant were sources of trouble, but fortunately their effect got smaller with increasing distance, because the imaged speaker was now further away from the audtor. If a wall, particularly a curved wall, was at some distance from the auditor, the reflected sound might arrive long enough after the direct sound to produce an echo; that was, a distinct, disturbing repetition of the direct sound. Reflecting walls that produced noticeable defects might be padded.

The most serious defect of reflection was the prolongation of sound in a room, called reverberation. When sound arrived at a wall or ceiling, it was reflected, absorbed, and transmitted in varying amounts depending on the nature of the reflecting surface. A hard plaster wall, for instance, reflected 95 per cent. or more of the incident sound, and therefore absorbed but little; whereas a layer of hair-felt, one inch thick, might absorb 55 per cent. with a correspondingly smaller reflection. If a room was bounded by plaster, glass and wooden surfaces, very little absorption took place and the sound might be reflected 200 to 300 times before it became inaudible. This meant that the utterances of a speaker would overlap and produce confusion for listeners. What was desired was to have each utterance rise to a suitable intensity and produce its effect on the listener and then die out so as to leave the field free for the succeeding utterance.

The use of carpets, hair-felt, and similar materials increased the absorption, and furnished the means for controlling the reverberation in a room. An audience was an excellent absorber of sound due to the clothing worn. In the winter time, when overcoats and heavier clothing were used, the absorption was greater than in the summer time. An auditorium filled with a large audience might be satisfactory, but it was the modern practice to install absorbing material to avoid defective acoustics for small audiences or for rehearsals in the empty hall.

An all-important question arose as to the amount of sound-absorbing material that should be installed for good effect, and this had been answered by obtaining the opinions of auditors regarding auditoriums already possessing good acoustics. It was found for best effect that a standard sound should die out in two seconds or less, depending on the size of the auditorium. Calculations could then be made to determine how much material would be needed for the auditorium to secure the required time of reverberation.

Having determined the amount of material needed for optimum acoustics, the question arose as to where it should be placed. Experience showed that some walls were more likely to give troublesome reflections than others. For instance, a rear wall might re-

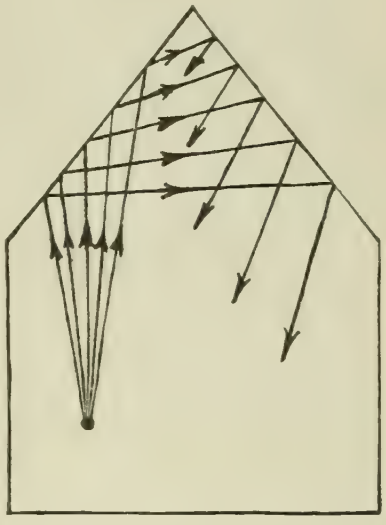

Fig. 2

flect sound to an auditor near the speaker and produce an echo; that was, a repetition of the direct sound that was noticeable. That result followed if the time interval between the direct and reflected sound was about one-tenth of a second or more, for which the difference in path of the two sounds was at least 112 feet, and the reflecting wall was about 56 feet distant from the auditor. With the wall at a greater distance, the echo would be worse. If the reflecting wall was curved, which was often the case, a focussing action followed and the echo was more pronounced. To reduce this defect it was desirable to place sound-absorbing material on such reflecting walls, particularly those at some distance from the stage. This practice found commendation for another reason. Experiment had shown that better acoustics were obtained if the walls about the speaker or musician were left reverberant while the absorbing material was placed on the walls nearer the audience. Under those circumstances, the speaker or musician found that it was "easy to speak or play," and the auditors found the listening satisfactory.

The shape of an auditorium was a matter of consideration. Generally speaking, a rectangular shape was preferred. Curved walls produced eccentric actions on sounds and might set up bad echoes. Balconies were usually advantageous acoustically, since they tended to break up sound in the otherwise large space. Gothic ceilings were beneficial to acoustics, because they reduced the possibility of echoes, and because sound-absorbing material was more effective on such surfaces than on a flat ceiling.

Large auditoriums were more difficult for good speaking than small ones. The reflecting walls were some distance from the auditors, with possibilities of echoes and blurring of speech. Electric loudspeakers served to amplify a speaker's voice, but they might produce some distortion. Music was an advantage in large rooms, more so than a speaker, because musical instruments had possibilities of greater volume of sound. (See Fig. 2.)

Music required the same acoustic adjustment of auditoriums for optimum conditions as speaking. Increasing the sound-absorbing material beyond the optimum made the room deader, so that music sounded dry and lifeless, but the speaking became more distinct. If less sound-absorbing material was used

than required for the optimum, music still sounded good, but speaking rapidly got worse.

The important requirements for good acoustics in a room might be enumerated as follows :—

1. The reverberation or prolongation of sound should be controlled by installing an amount of sound-absorbing material in proportion to the volume of the room.

2. The sound in a room should have sufficient loudness; a condition that was brought about by reflection from the various surfaces of the room which reinforced the direct sound. If the speaker or musical instrument produced only a weak sound, no arrangement of the room would increase the loudness, except by the use of an electric loudspeaker.

3. Speaking should be distinct. For this purpose it was desirable to arrange the reflecting surfaces near the speaker, and to apply absorbing material to selected walls.

TABLE I.—*Absorbing Coefficients of Common Materials.*

	Coefficient per sq. ft.
Open window (absorbs all sound falling on it)	1.00
Hair-felt, one inch thick... ...	.55
Plaster walls	.025 to .034
Glass	.027
Concrete	.015
Varnished Wood	.03
Carpets	.15 to .25
Audience (per person, about 15ft of clothing)	4.7
Wood seat	.2

Inspection of this table, said the speaker, showed why a room lined with plaster, glass, and wood was reverberant—the surfaces absorbed but little and the sound would persist several seconds before becoming inaudible.

An all-important question arose as to the amount of sound-absorbing material that should be installed for good effect, and this had been answered by obtaining the opinions of auditors regarding auditoriums already possessing good acoustics. Before discussing the answer to this question it should be stated that the reverberation depended also on the loudness of the sound and on the volume of the room; larger rooms, with the reflecting walls further apart, would have a longer reverberation. Those factors might be put into the statement : the time of reverberation t was directly proportional to the loudness of the sound and to the volume V of the room, and inversely proportional to the absorbing material a present. Putting this in the simplified equation we got : $t = .05\ V/a$, where the factor .05 represented a standard loudness.

As a simple example the lecturer took an actual room 148 ft. long, 57 ft. wide, and 23 ft. average height; the volume being approximately 194,000 cu. ft. The absorption a in the room was calculated from the coefficients in Table I. as follows :—

	Units.
Wood floor, 8,436 sq. ft. at .03... ...	253
Plaster ceiling, 8,436 sq. ft. at .033 ...	278
Plaster on tile walls, 9,430 sq. ft. at .025	236
1,000 seats at .15	150
Absorption for the empty room ...	917
Average audience (330 people) at (4/.7-.15)*	1,500
Absorption with average audience ...	2.417

* When an auditor occupies a seat its absorption (.15) is subtracted.

It should be noted that the absorption of the audience was nearly twice that of the surfaces in the room. This was due to the clothing worn. Continuing with the calculations, we found the time of reverberation for the empty room to be :—

$$t \text{ (empty room)} = .05 \times 194{,}000/917 = 10.6 \text{ seconds,}$$

and for the average audience,

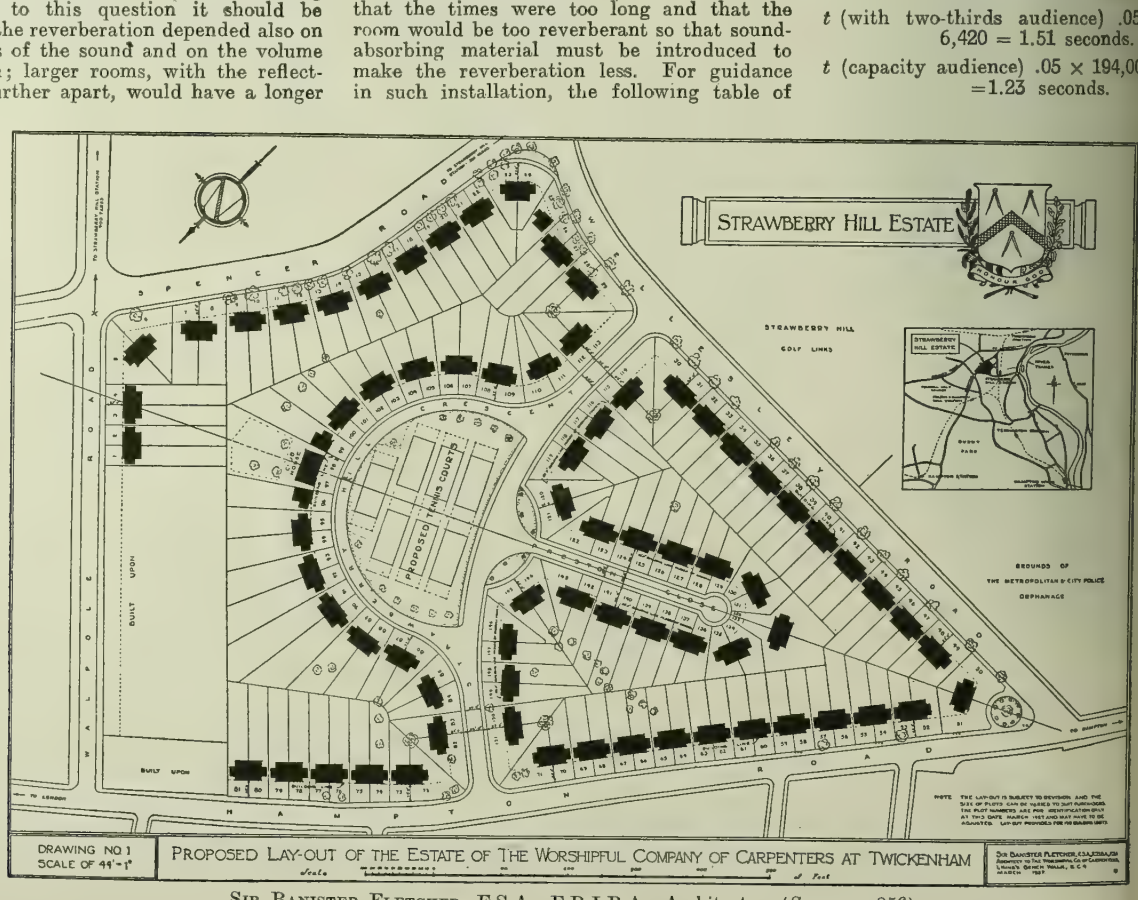
$$t \text{ (average audience)} = .05 \times 194{,}000/2{,}417 = 4.02 \text{ seconds.}$$

That was, a standard sound would persist 10.6 seconds in the empty room and 4.02 seconds with an average audience present. Comparing these results with those for auditoriums having good acoustics, it was found that the times were too long and that the room would be too reverberant so that sound-absorbing material must be introduced to make the reverberation less. For guidance in such installation, the following table of optimum values of the time of reverber and absorbing material had been prepar

TABLE II.—*Optimum Time of Reverbe and Optimum Absorption.*

Volume of Room. Cu. ft.	Optimum Time. Seconds.	Optim Absor
3,300 ...	1.0 ...	
12,900 ...	1.1 ...	
33,000 ...	1.2 ...	1,
63,000 ...	1.3 ...	2,
117,500 ...	1.4 ...	4,
186,000 ...	1.5 ...	6,
276,000 ...	1.6 ...	8,
407,000 ...	1.7 ...	12,
550,000 ...	1.8 ...	15,
750,000 ...	1.9 ...	19,
1,000,000 ...	2.0 ...	24,

Inspection of the table revealed one i tant fact—that the optimum time was not exceeding two seconds for an audit of 1,000,000 cu. ft. Defective audito usually had too long a time of reverber



If they applied these optima to the of the room first described, the volum 194,000 cu. ft., which would require an mum time of about 1.51 seconds, and would be obtained when approximately units of material were in the room. Su optimum acoustics were wanted for a thirds capacity audience. The room a had 917 absorbing units for the empty to which should be added 3,000 units two-thirds audience, giving a total of units. To this must be added 2,500 u give the optimum of 6,420 units. If h was selected as the sound-absorbing ma the 2,500 units would require 5,550 s (5,550 at .55 = 2,500 units), which mi applied in panels on the ceiling. Su up, the times of reverberation for th rected room would be :—

t (empty corrected room) $.05 \times 194{,}000$ = 2.82 seconds.

t (with one-third audience) $.05 \times 19$ 4,920 = 1.97 seconds.

t (with two-thirds audience) $.05 \times 19$ 6,420 = 1.51 seconds.

t (capacity audience) $.05 \times 194{,}000/7.9$ =1.23 seconds.

block of flats has been erected at ck Gardens from the designs of Mr. Roberts, A.R.I.B.A., and Messrs. . The accommodation provided may died from the plans reproduced upon our supplementary plates. The general ctors were Messrs. Gaze, of Kingston, ne following were sub-contractors :— . F. H. Wheeler, electric installation; . J. H. Nicholson and Co., Ltd., heat- d hot water; Messrs. Waygood-Otis, ifts; Messrs. Stuarts Granolithic Co., al stonework; Messrs. Norris, iron se; Messrs. Crittalls, metal windows.

St. Peter's, Lowick.

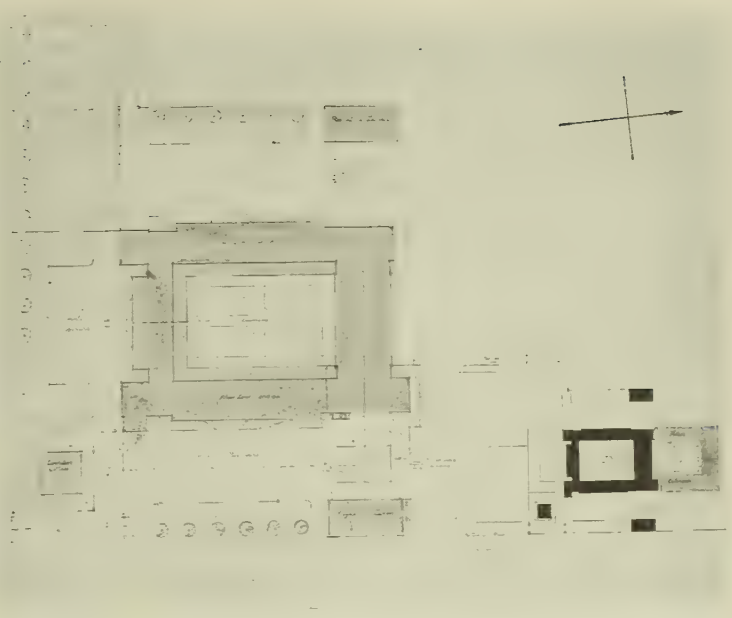
church of St. Peter, Lowick, is one of hich form the well-known Nene Valley lying between Northampton and Peter- h. The west tower, which is the sub- these drawings, is later in date than ly of the church, and, with the excep- the famous Boston "stump," is the example we possess of the octagonal on a square base. Unlike the neigh- example at Wilby, this lantern was ended to carry a spire. The tower is the local oolite, and is somewhat un- ke in construction, cornice mouldings attlements being scribed over one in a curiously hasty manner. A local n says that there was rivalry between and Tichmarsh as to which village have the finer tower, and that when ster-mason of Tichmarsh saw this he went away and hanged himself. drawings which we reproduce are by nald McMorran, and gained the Pugin ship.

al National Orthopaedic Hospital.

extensions to this hospital consist of new out-patients' department ap- d from a new main entrance in Bol- eet. From this entrance a wide, well- dor leads direct to the new waiting- large well-proportioned hall some ong and 32 ft. wide. It is flooded ht and its main feature is the decora- sually these halls lack interest, but ase the patients' attention is at once p with the series of decorated panels, ly representing a month of the year. re the work of Miss Nan West and attractive feature of the buildings. e waiting-hall are the consulting and -rooms, also an operating theatre for perations, with sterilising, anæsthetis- ster and recovery rooms *en suite*. from the hall is a corridor, which gives access to rooms in which patients are measured for and fitted with surgical boots, instruments, etc. The exit is from the further end of the hall and leads into Euston Road, so that cross-traffic within the hospital is eliminated. A second corridor from this hall leads to the electrical department. In this case the old out-patients' department has been remodelled and adapted for physio-therapeutic treatment and contains rooms for all the most modern forms of electric massage and light treatment, the old hall itself being used for gymnasium purposes.

The old electrical department has also been reconstructed and now contains a large room for X-Ray work with dark-room adjoining, as well as accommodation for medical officers, waiting-room and private treatment. The basement under the new out-patients' department is taken up with large workshops for instrument makers. These are well lit and ventilated and contain all the most modern machinery for instrument work.

The front portion of the buildings facing Bolsover-street has a first and second floor. The first floor comprising bedrooms, etc., for medical officers, also a large lecture and reading-room, while the second floor consists of bedrooms and lavatory accommodation for nurses. A further feature of the buildings is the provision of panel heating, by which wall and ceiling surfaces are warmed, enabling pipes and radiators to be eliminated, thereby leaving fewer places for dust and dirt to collect.



The architects for the new buildings are Messrs. H. F. Murrell and R. M. Pigott, FF.R.I.B.A., and the builders, Messrs. Holloway Bros. (London), Ltd.

Following is a list of the sub-contractors—Duncan Watson and Co., lighting; Rosser and Russell, Ltd., heating; Crittall Manufacturing Co., metal casements; Mellowes and Co., Ltd., lantern lights, etc.; Carter and Co., Poole, terrazzo tiling; J. P. White and Co., special doors; Adams, ironmongery; Benjamin Clemens, sculptor; Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., fire-resisting floors; Limmer and Trinidad Lake Asphalt Co., Ltd., asphalt; North British Rubber Co., Ltd., rubber flooring.

Strawberry Hill Estate, Twickenham.

The Strawberry Hill Estate at Twickenham, belonging to the Worshipful Company of Carpenters, is being developed as a good-class residential district in accordance with the lay-out plan prepared by and under the supervision of Sir Banister Fletcher, F.S.A., F.R.I.B.A., F.S.I. The estate, on which many fine old trees exist, has a good open situation, occupying practically an island site and overlooking the Strawberry Hill golf course.

Plots for some 150 houses are shown on the lay-out plan, giving an average of 8 to the acre, and the land has been spaced out to allow for the erection of a garage to each house, if required. The perspective which we illustrate gives a general view of the estate, showing its axial planning and crescent-shaped central feature, which is being set aside for tennis-courts, and the provision of blocks of good-class flats at the corners of the cross road

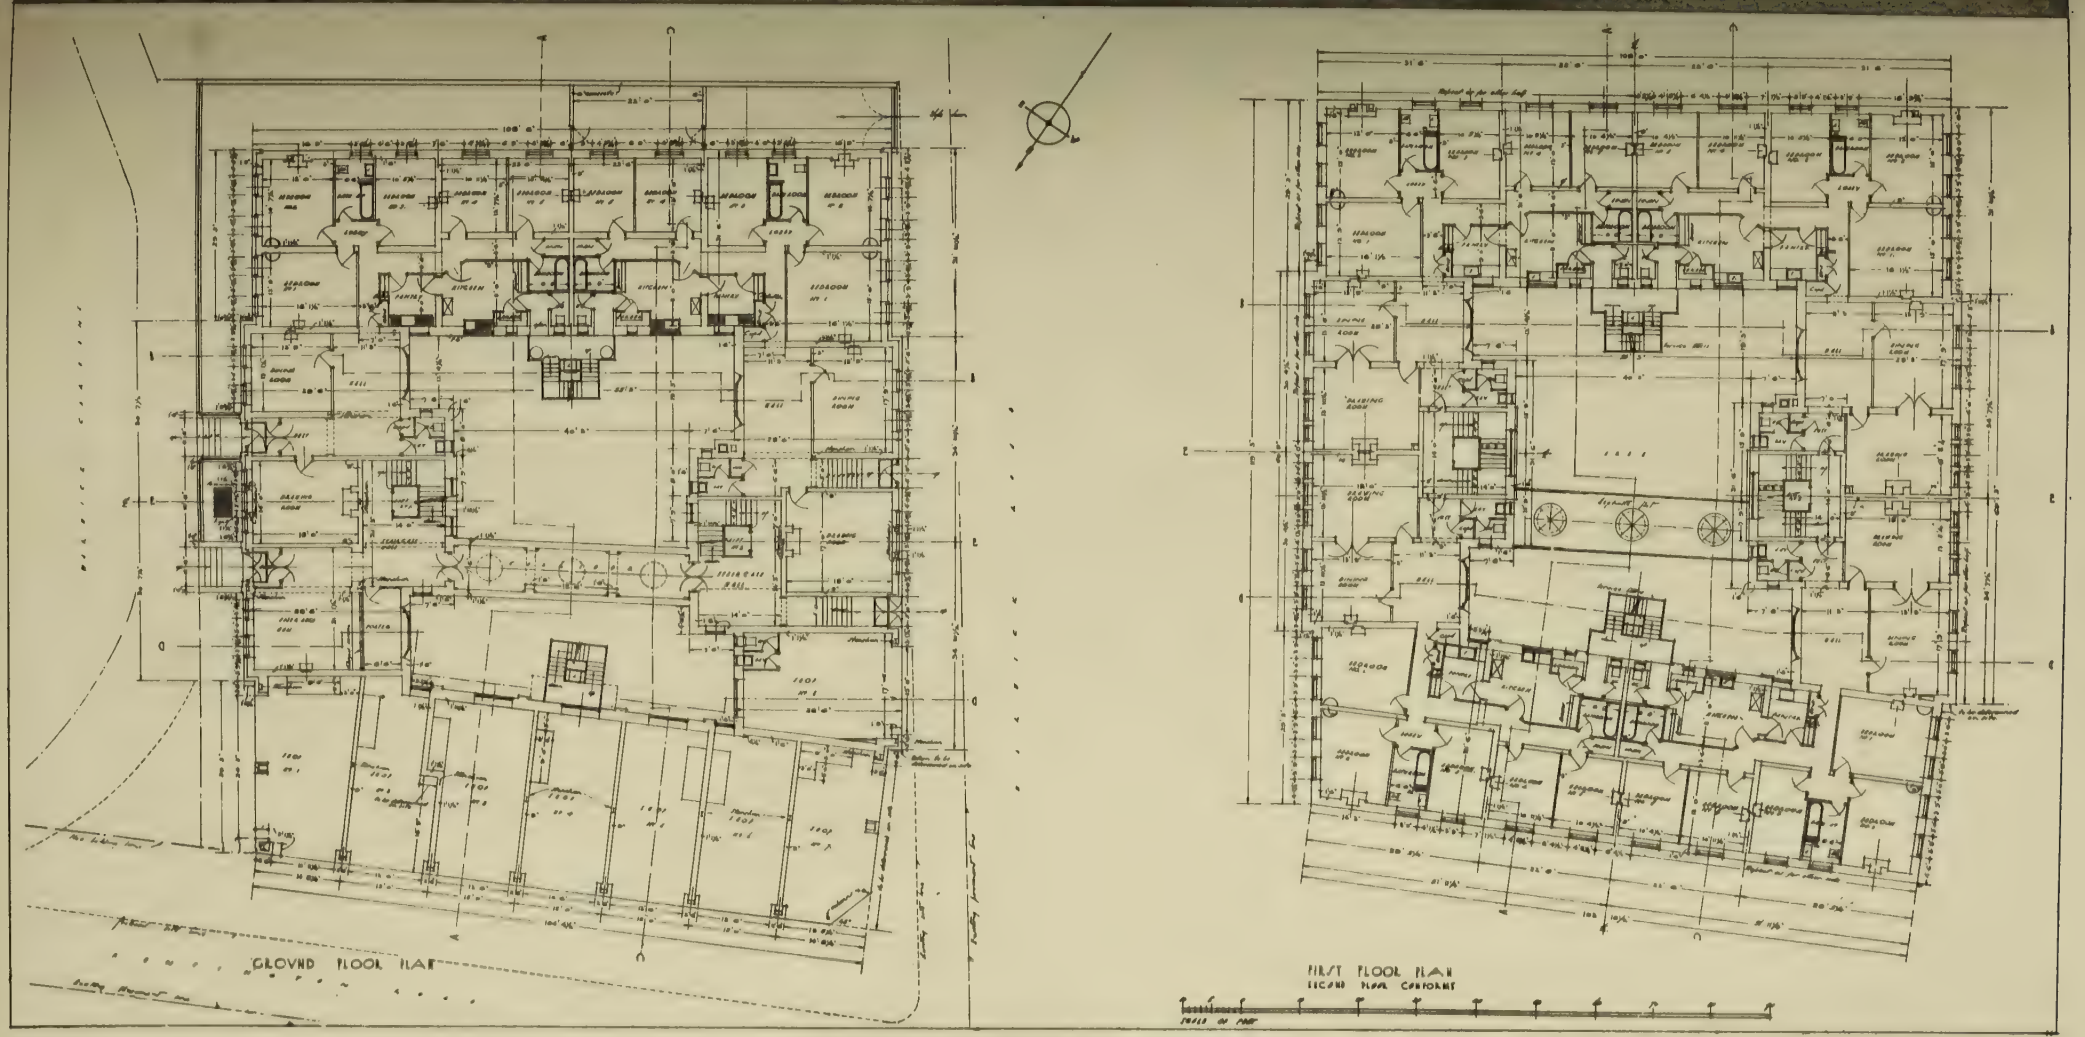
"Electric House," Battersea.

We illustrate this week the "Electric House," which has been erected by the Battersea Borough Council. A description of the work is given on page 864. Mr. T. W. A. Hayward, M.Inst.C.E., is the Borough Surveyor, and Mr. Henry Hyams, F.R.I.B.A., the architect.

Historical Monuments in France.



Sir Banister Fletcher, F.S.A., F.R.I.B.A., lecturing on Wednesday of last week at the Central School of Arts and Crafts, on the subject of Romanesque architecture in France, preceding the great cathedral-building or Gothic epoch, described how Romanesque architecture, indirectly derived from Roman, evolved a series of different constructive expedients in different parts of the country, and eventually produced the Gothic style, at first reluctantly in the south, but with more grace in the north. There were few buildings in France at that time, except those left by the Romans, and these naturally determined the main character of French building during the period when the style was called Romanesque.

These ancient churches showed the intertwined histories of English and French kings when much of France belonged to England, and there were many architectural changes. France, said the lecturer, had not the marble of Italy, but good building stone, and had great vivacity and inventiveness. The great dividing line between peoples and styles was the Loire, and vaults and domes in the south against the usurping arches and concentrated thrusts of the north showed how the latter style, from its distance from Roman influence, grew more progressive in spirit, and led up to the building genius of the "Ile de France."

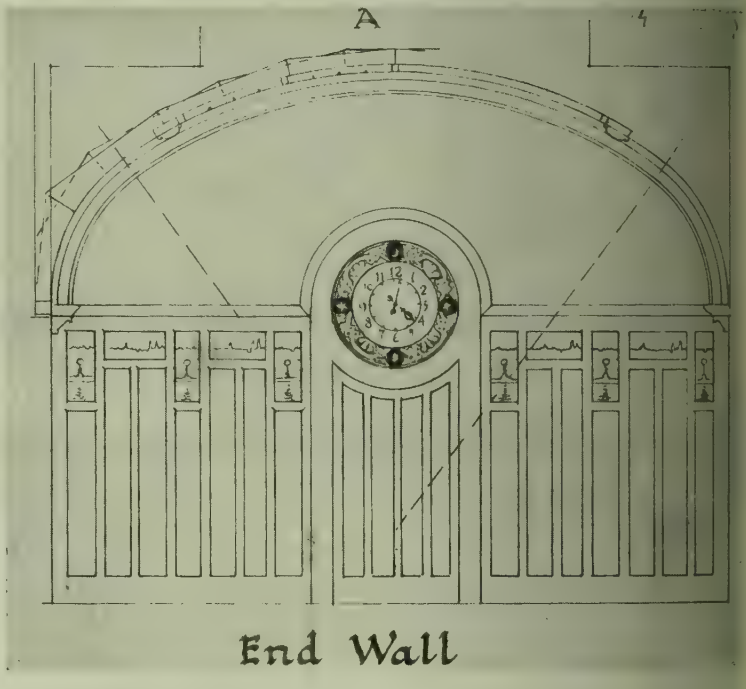
BATTERSEA COUNCIL'S "ELECTRIC HOUSE"

THE "Electric House," which we illustrate this week, has been erected in Lavender Hill for the Battersea Borough Council, and was opened on October 29. It is the associated work of the Borough Surveyor, Mr. T. W. A. Hayward, M.Inst.C.E., and the architect, Mr. Henry Hyams, F.R.I.B.A. The interior, with its decoration, has been designed and carried out under the direction of Mr. Hyams, who, it is evident, has put a great deal of thought into a work which is full of interest. The electrical installations and equipment were designed by Mr. F. Bond, the Borough Electrical Engineer.

Electric House has an area of about 4,000 sq. ft. and a frontage of nearly 65 ft next to the Post Office in Lavender Hill. About 13 ft. of this frontage is given to a cartway to an electricity sub-station and to a depôt to be used for highway purposes.

Including the basement, the building has six stories. The carcase is of brick, the floor and roof construction of steel. Faced with Portland stone and roofed with Westmoreland slates, the elevation rises to a height of 54 ft. Electric flood lights are provided at the eaves for illuminating the front of the building, and on the first-floor level an electric clock is fixed, with dials showing up and down Lavender Hill. Above the fascia are more electric flood lights, and electrically lit stone window boxes for flowering plants. The fascia itself is of Devon marble, with aluminium letters and borough arms lit with concealed electric lamps. Additional lighting is provided in the soffits of the arches below. From the pavement an entrance under these arches gives an open space in front of the shop windows paved with squares of light and dark green marble. Greek Cippolino marble columns flank the bronze entrance doors, above which is a carved San Stefano marble panel of the borough arms and symbols of electricity. The caps of the columns are also carved with symbols of electricity.



The basement consists of showrooms, stores, repair shop, unpacking room, storekeeper's office, and switch room.

The ground floor is planned with a large central hall and three typical dwelling-house rooms on either side, a lighting demonstration room, two offices, and two shop windows.

The first floor has a large demonstration and lecture hall and the borough electrical engineer's office with waiting room and typist's room adjoining.

The second, third, and part of the fourth floor are for the provision of offices, and a small flat is built on the remainder of the fourth floor.

DETAIL OF CLOCK.

PARTHENON STUDIES.—X.

By W. R. LETHABY.

THE METOPES.

The original metopes at the British Museum are from the south flank of the temple, and, as is well known, these represent the battle of the Lapiths, assisted by Theseus, the Athenian hero, against the Centaurs. From the fact that these are so well known, we are likely to get an impression that the sculptured panels were all of this type, and further, that they were more or less what we call "decorative." The subjects, however, were different on the several fronts, and all were important in the story-telling function of the building. On the east front, under the Birth of Athena in the pediment, was represented the Battle of the Gods and Giants, by which the world was made fit for human habitation On the south side, as just said, was the fight with the Centaurs, in which Theseus took a leading part. On the north side of the temple was represented the final scenes of the Trojan War, where the Greeks obtained the victory by favour of Athena. The west front metopes contained sculptures of other battle scenes, which are generally said to have been the war of Greeks and Amazons, but were more probably, I think, the victory of the Greeks over the Persians.

Together with the great sculptured groups in the pediments, the metopes represented the special relations of the goddess with her city from primitive days in a sort of stone book of Genesis, or history of Athenian culture—"The Victory of Hellenism over Bar

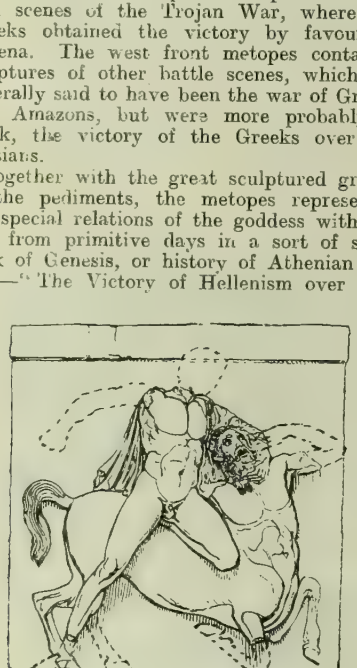

Fig. 1.

barism, Hellas against the brutish world." All was wrought to the glory of Athena. It is usual to speak of the metopes rather slightingly, and this is all the more easy, as at the Museum they are skied as if it were the Royal Academy. Haydon, however, who had really seen them, spoke of "That divine form in a metope grappling a Centaur by the throat, heaving up his chest and drawing in his breath, preparing to annihilate his enemy (Fig. 1); or the one in all the relaxation of death under the legs of the Centaur who prances in triumph; or the other, who dashes back his opponent as if lightning flashed through his frame."

It is often stated that these panels are in a more archaic style than the rest of the sculptures, but this is not evident to all observers. It has even been argued that they may have been prepared for an earlier building. Probably many of the metopes were the earliest of the sculptures to be finished, but it is only an assumption that the whole series was ready for building in as the work went on. Real building operations are not often so regular as that, and it is not impossible that all were carved in position. That those of the two ends were carved and fixed before the great sculptures of the pediments were hoisted into position is difficult to believe. I cannot discern any real archaism in the metopes. The workmanship is advanced, several figures are undercut almost to separation from the ground, and some of the limbs strike boldly outwards. One of the women lifted from the ground dangles helpless feet from under the edge of her skirt in a very realistic way. The drapery of another woman flies back over the knee of a Centaur, which shows through it (Fig. 2).

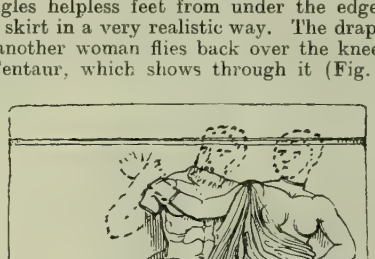

Fig. 2.

Several of these Centaur groups show a grim sort of humour, the combatants grasp one another's hair, one Lapith is tripped backwards over a wine jar, and a fragment shows a Centaur's hoof trampling on his opponent's toes. Two or three have the combatants with legs interlocked in wrestling attitudes, and these suggest swift movement in a masterly manner. The composition of most of them is wonderfully balanced, whilst the figures fill the ground like very skilful heraldic charges. Collignon says that one or two have "a certain dryness," and this is the uttermost that may be allowed. They are marvels of design and craftsmanship, and it is absurd that more than a dozen of these great sculptures which we possess should be put away where they cannot be examined—some day they must be re-discovered and really exhibited. Lord Elgin, more than a century ago, had recommended that only casts should be placed in situations out of reach, and this is obviously the only policy that can be maintained.

Although the relief is so high, the block form of the original stone in which the groups were sculptured was retained as much as possible by keeping many of the high points in the plane of the original surface of the blocks. This method is suggested in Fig. 3, which, however, has no claim to accuracy. Fig. 4 indicates in a similar way the disposition of the sculpture on the ground.

Although the character of the Centaur subjects, representing barbaric conflict, has suggested archaism; many less known, such as the Apollo metope of the east front, the

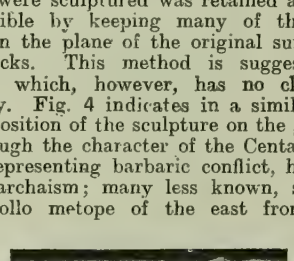

Fig. 3.

Aphrodite of the north, and others, were very beautiful indeed.

I find myself in agreement with what Lechat has said: "Perhaps no one has ever rendered exact justice to the metopes. These little living scenes, alternating with the rigid triglyphs, had an architectural office, but t were also noble sculptures, and the beauty their composition equalled their beaut workmanship."

The metopes are broken and cold, when fresh they were polished, brilliant colour, and glittering with attached bro accessories, as many drilled holes show. metope 3 of the Centaur series, the Lap has "a hole between the collar bones another on the lowest left rib, showing wh a sword belt has been attached. Two h are on the body of the Centaur: these have served for the attachment of a bro weapon." The Lapith in metope 4 ha metal wreath (*British Museum Guide*, 19 The wheels of most of the chariots re sented appear to have been of bronze. A hole appears on the photograph of metope east, where such a wheel must have b fixed. In front of the charioteer in 14 is a hole where a long bronze driving was probably pinned to the backgrou Dalton's excellent view of part of the so side of the temple, drawn in 1749, sh seven of the metopes (26-32) in place, they are so well drawn that losses since t time may be understood. No. 27 has man's right leg, and 28 Centaur's right a 29 was whole except for woman's head; was as now; 31 has lost man's left arm, wh fell straight; 32 man's left arm and existed. Some drawings by Pars and L Elgin's artists at the Museum are also v able records.

Among Haydon's drawings of the mar in the Print Room at the Museum, n about 1808, are some from the meto (One at least of the drawings from casts the Centaur groups at the Theseum prese details where the cast is now defecti There are also some unpublished draw by the accurate artist who drew the sc tures for *Museum Marbles*. of a selection of these old drawings woul a valuable aid to study.

East Front.—The fourteen metopes r senting the Battle of the Gods and Gi or great powers of evil, came first in cycle of sculptured stories. In 1908 I bro out the value of a restored drawing of metopes made by Feodor, Lord Elgin's a He evidently studied them closely fro scaffold when they were in a much b condition than now. "The Elgin dra [I wrote] is clearly very accurate in points which can be tested. These ea metopes cannot be profitably discussed every trace of what actually remains ca brought into comparison with these res tions made more than a century Material for this comparison may no found in *Sculptures of the Parthenon*, where Feodor's restorations are show association with photographs of the sculp in their present state. These restoration thus seen to explain in several cases would otherwise be obscure or irrecove Lists of former attempts at identifying subjects are also set out and discussed these it seems to be rightly observed the attempt of Carl Robert (1884) wa most convincing. As is pointed out, ever, he certainly interchanged two me one containing Apollo and the other Her Having the drawings of Feodor to co with the vestiges, these two panels are

t easy to interpret of the whole. On
er hand, I have no doubt that Robert
ght in explaining the two central
as representing the chariot of Athena
contest with a giant. In regard to
er, Feodor had made the mistake of
very slight traces as those of a male

fourth in metope 7 would be for
She, as well as Zeus, had a wait-
ot in the sculptures of the great
Altar. It would follow that the

Fig. 6.

goddess occupied the next panel 8. Lord Elgin's draughtsman, however, interpreted the figure in metope 8, which on this hypothesis should be that of the goddess, as male, and this view is accepted in *Sculptures of the Parthenon*. Yet Athena was a famous giant queller, and this was her own temple.

The traces of the body of the principal figure on the existing metope 8 are very slight, and Feodor's restoration of it is obviously incorrect in important points which can still be seen on photographs; it must have been much decayed when his drawing was made. From the evident slenderness of the figure, the energy of the attack, and the way the shield is carried, the remnants themselves (apart from Feodor's interpretation) suggest Athena rather than any other. In Fig 5 I give my own impression of the

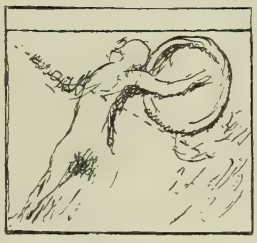

Fig. 5.

decayed panel, indicating what may be read into the traces with a little imagination. The general attitude, outstretched arm, and the shield are quite certain. This shield and the whole attitude are typical of Athena (compare illustrations in Miss Harrison's *Athens*, pp. 442-3, and Reinach's *Vases II*, pp. 21, 41, 102, 204). Pars, in his drawing of the E. front, seems to suggest that the figure had a female skirt.

Further evidence for the identification is furnished by two metopes found at Selinus by Angell and Harris—one archaic and the other of mature style—which represent Athena's victory over a giant. There is a cast of the former in the British Museum, and an illustration of the later one may be found in Bell's *Hellenic Architecture* (p. 90). In both these the legs of the figure tell strongly through the drapery, and one may see how the thought that it was a male might easily arise. This metope must have been very like the group of Athena and the giant in the pediment of the old temple, and this subject was also embroidered on the peplos of the cult statue.

The photograph of the chariot and winged horses in metope 7 given in *Sculptures of the Parthenon* shows that this panel was of the highest beauty, mature style, and most delicate craftsmanship, an altogether lovely work. The horses seem eager with eternal freshness. It may be regarded as proved that this was Athena's chariot and that her victory over an evil power was represented in the next panel. Restored drawings of these might be made with fair confidence. (For chariots with winged horses see Reinach's *Vases II*, pp. 46, 309.)

Metope 9 represented the victory of Apollo over a power of darkness. His opponent had a beast's skin over his left arm, and the subject was restored by Feodor as Herakles struggling with Apollo for the Tripod. There are no traces of a tripod, however, and the opponent of Apollo was really Tityos, as is made certain by several vase paintings (Reinach's *Vases II*, pp. 244, 245, 249, 269), in some of which the beast's skin appears. Enough remains on the metope itself to show that Apollo's figure was of great beauty. Unfortunately, only a very small print of an excellent photograph of it is given in *Sculptures of the Parthenon;* if the negative still exists, a much enlarged version of it would be very valuable. I give in Fig. 6 a sketch made by comparing the little photograph with Feodor's drawing, which agrees very accurately with existing facts. The god sprang—indeed burst—forward, his nude body relieved against a voluminous mantle, which is falling off, and his hair streamed out behind. The polished bare body must actually have shone against the mantle arranged like a cloud, and doubtless of dark colour. It is evident that Apollo was here identified with the sun. "That the identity of Apollo with the sun was felt in the Periclean account is clear from the poets, especially from a fragment of Euripides." (Davidson, *The Parthenon Frieze*, 1882, p. 97.) The correspondence between the Parthenon panel and Euripides is so close that it looks as if the poet followed the vision of Pheidias.

"Out from the portico gleamed a god,
Apollon: for the bow was in his hand,
The quiver at his shoulder, all his shape
One dreadful beauty . . .
Apollo of the golden hair."

There is nothing of "dryness" or archaism in this radiant figure bursting from the clouds and thrusting darkness away. Watts might have imagined the subject in much the same way. Enough of this wonderful panel remains to allow, when compared with vase paintings, of a restoration being made which would give us back knowledge of a noble Pheidian type and a composition of extraordinary beauty. (Compare a nude Apollo with long hair, Reinach's *Vases II*, 269.)

Metope 11, with Herakles between two lesser figures, has a parallel in one of the archaic metopes from Selinus, of which a cast is in the Museum. The figures with whom Herakles grapples are the Cercropes, "two brothers who practised every kind of knavery."

The metope 4, which balances 11, like it contained three figures; the chief one in this case was female, most probably Hera. Metope 12, a goddess pursuing a giant, is probably, as most generally agreed, Artemis. Dionysos of metope 2 had a panther by his side who sprang at the foe; similar groups are found on the vases, and a fairly secure restoration of it might be made. The chariot of metope 14 rose from the sea and had fish playing about the wheels as Homer tells of Poseidon's chariot. There is nothing of dryness in this poetic work, but rather the emergence of a "landscape element." The wheel of the chariot was of bronze, as the hole for attaching it shows the driver held a long bronze rod. Chariots in several other metopes must also have had bronze wheels.

These eastern metopes could be safely represented on a small scale, while half a dozen could be restored at a larger size. Such a method would give back general knowledge of the series in such a way that we might forget the ruin and decay and regain what would be commonly understandable.

South Side.—These metopes were mainly of the Centaur battle, but a set at the centre related to other early Greek stories. The distribution appears to have been thus:—12 : 8 : 12; that is, 1 to 12 : 13 to 20 : 21 to 32. In the Museum *Guide* for 1903 it was held that the arrangement was rather 12 : 9 : 11. No. 21, which by this lop-sided arrangement was assigned to the middle group, "represents two women standing by an archaic statue." In the study I made of the facts in *Greek Buildings*, 1908, I pointed out that a similar subject to 21 is represented as part of the Centaur battle on the frieze from Bassae in the Museum: "Two women who have taken sanctuary at a sacred image are attacked by a Centaur. . . . The panel 21 at the Parthenon must belong to the Centaur series. It furnishes, in fact, the episode around which the action develops . . . we may suppose that the central series had a background of a different colour from the rest." I also pointed out the evidence of a painted vase of the subject which showed two women taking refuge in a shrine—"thus was the story brought into relation with the goddess." The arrangement 12 : 9 : 11 is still maintained in *The Sculptures of the Parthenon*, 1910. "The nine central metopes" are considered as forming one group, and we are told that "the Centaur series is resumed" with 22.

It is only loose talk to speak of "nine central metopes"; the one-sidedness of the arrangement 12 : 9 : 11 is apparent enough, but in fact it would have been worse seen in relation to the columniations of the temple. Considered in this way we get $6 : 4\frac{1}{2} : 5\frac{1}{2}$, an altogether impossible arrangement.

The details of these metopes are very well and fully described in the volume just named. They have since been studied by Studniczka (*Neue Jahrbücher*, 1912), who greatly helps in elucidating their subjects, and by Schrader, who has brought forward a theory of rearrangement which I do not think very impressive. The subjects were events in primitive Greek story parallel to stories in the Book of Genesis. Pausanias, telling how Triptolemus was the first to sow corn, adds: "The Athenians were first in ancient descent and possession of gifts bestowed by the gods."

In the illustrations of *Sculptures of the Parthenon*, several minor fragments are shown restored as parts of these panels. The fitting of them into the drawings of 1674 prove how accurate these records are. I will here only briefly comment on what is shown and said.

13. *Woman and Man.*—In the description the latter is supposed to be a female, but the bony forms, exposed feet and style of drapery proclaim it to be male.

14. *Youth and Maiden.*—These, with the two in 13, are supposed to be the three daughters of Cecrops with their brother, but this cannot have been so if, as said above, the second figure in 13 is a man. The maiden held a casket and she probably did represent a daughter of Cecrops, while the youth was her brother.

15. *Chariot Group.*—The wheel was probably of bronze as in some other cases The first yoking of horses?

16. *Two Males.*—One, a youth, is prostrate, apparently after a struggle.

17. *Man and Lyre-player.*—The latter in long robes is sometimes described as a woman. Two fragments are restored to this figure. Another piece of drapery from knee to foot is assigned to panel 18, but it belonged rather to 17. The foot is big and exposed, and the lyre-player must have been a male clad in the fashion of the lyre-playing Apollo. Lyre-players on the frieze are males in similar dress, as was pointed out by Murray. The invention of Music?

18. *Two Women.*—With them is an image. I suggest that these may be the two other daughters of Cecrops excluded before. Compare Fig. 65 in Miss Harrison's *Themis*, where the two sisters appear very like the two figures on this metope. See also Fig. 64 in the same volume, where an image of Athena is shown.

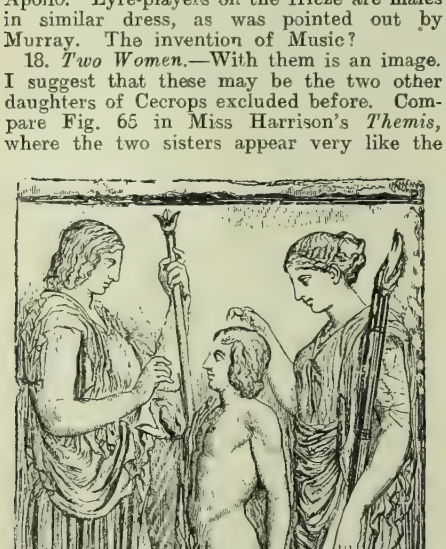

Fig. 7.

19. *Two Women.*—These dignified, finely clothed figures must have been especially beautiful. The second one is draped in a fashion like the priestess of the E. frieze, and one of the figures of the Eleusis relief (Fig. 7).

20. *Two Women.*—The first of these held a folded cloth very like the peplos of the E. frieze. It is clear from the old drawings and the few fragments which exist of this series that these panels were of great beauty and of fully matured style. The women were lovely figures, entirely free of "dryness" or archaism. The Centaur series is resumed in metope 21.

Metope 29, near the right-hand end, is an especially fine group of a Centaur carrying off a woman. "The drapery of the Ionic chiton is finely wrought." This panel is very similar to one of the Centaur groups in the pediment at Olympia. In metopes 30 and 31 the Centaurs are triumphant. In 32, the last, the man has the advantage, and he seems to have had a special character. "Carrey, Pars, and Feodor indicate he wore a helmet," and probably he held a sword (Fig. 8). I would see in this upstanding warrior Theseus or Peirithoos, probably the latter. Metope 2 next the beginning of the whole series has a Centaur which is actually subdued by another of the combatants, probably Theseus (Fig. 1). This is the figure that was described by Haydon as "preparing to annihilate his enemy." That Theseus was recognisably here may not be doubted; the panels were not chance combats with Centaurs, but the struggle at the marriage feast of Peirithoos, as is proved by the presence of the women, the shrine scene, and by the fact that wine-jars are used as weapons. The whole was a Theseus subject, and the hero might not be left out. In the *Handbook* of 1851 it was properly observed by Vaux: "The subject was congenial to the Athenian mind because their great hero Theseus took part in it."

Fig. 8.

North Side.—These metopes represented the Trojan war, or rather the fall of the city. It has been suggested that there may have been a group with a different subject in the centre, as was the case on the other flank, but the evidence seems against this. The key to the decipherment was found in metopes 24 and 25, which show Menelaus pursuing Helen, while Aphrodite intervened. Michaelis compared the composition with that of the same subject on an Attic vase in the Vatican, which very closely resembles it except that a fourth figure behind Menelaus is on the vase, a female (Persuasion) rather than a second warrior, as on the metope. The subject occupies two metopes. (At the Theseum also two metopes are devoted to one subject.) The identification of the subjects on this side was long resisted in England.

The figure of Aphrodite in the metope is much ruined, but that the vase represented it accurately is confirmed by the fact, which I noticed several years ago, that the figure of Alkestis on the column at Ephesus repeats the type of figure on the vase very closely. There are several other echoes of the Parthenon sculptures at Ephesus, and it may not be doubted that the lovely figures of Alkestis on the column and Aphrodite on t followed a common original, which figure of Aphrodite in the metope.

Fig. 9.

Fig. 10.

the same figure reappears in a late the Palace Albani, on which echoes Pheidian types may be observed This relief is reproduced in Schrader on the Parthenon (p. 310).

What remains of the figure of A on the metope well agrees with the the lovely figure at Ephesus. F photograph of this metope it appea this figure was tall and elegant, h long mantle brought round to the fro folds radiating towards her right hand was held in front of the breast; be mantle appeared a tunic which fell pointed towards the front (Fig. 10). vase the left arm is more lifted than metope, but the sculpture, as seen f low, would suggest this to some deg the Museum is a fragment from t shoulder of a draped female figure assigned to a metope which looks might have formed part of Aphrodite described as "right shoulder and b draped female figure; the chiton faste the shoulder with four studs." The this figure of Aphrodite may be trac where than at Ephesus. The Artemis echoes the gesture, and in Reinach's a figure at Athens itself is given p. 423 (12)), which recalls it (see p. 669 (12)). There is also a funerar in the Louvre (Collignon, Fig. 200 resembles this figure, as does also on weepers of the Sidon Sarcophagus (C Fig 2 (3)). Compare a vase by H the British Museum (Miss H *Prolegomena*, p. 556). The same drapery, fully adjusted, with the hang tion over the left shoulder, is used of the two noble women's figures famous relief from Eleusis, which is g recognised as a work of Pheidias One of the women's figures in the group of the south side was also d the same way.

(To be concluded next week.)

Imported Furniture.

The Standing Committee under t chandise Marks Act recommend that furniture and cabinet ware made w mainly of wood, whether imported in parts, including upholstered furn the frames thereof, and also cabi wooden trays of the descriptions cus sold through the furniture trade, sno an indication of origin. It is recor that the Order in Council, which is t the wholesale trade, should come i three months after it is made.

SOCIETIES AND INSTITUTIONS

orthern Architectural Association.

he course of a paper on "Concrete einforced Concrete" read before this ation on November 16, Mr. T. H. ubtedly one of the reasons for the nce to adopt concrete façades had been ness and greyness, two factors which ot to any extent relieved by mould- rnices, and other features of design. acing materials, however, required to sidered from the point of view of and texture, and why not concrete? revolutionary to suggest that con- ight be considered as reconstructed r that the exposure of the stone par- as not violating the æsthetic sense s essentially a true revelation of a ory building material? By the care- tion of sand and aggregates, both in to colour and size, excellent decora- ects could be obtained by brushing e of the concrete while it was still ith a stiff wire brush and plenty of hus removing the surplus cement and and exposing the aggregate. For al buildings a sufficiently pleasing uld be obtained by the use of ordi- gregate. For the best work, how- would be necessary to use a specially aggregate for the facework, which, xposed, would harmonise with the f the surroundings. The thickness special facing might vary from $\frac{3}{8}$ in. and the maximum size of the aggre- d would be from $\frac{1}{4}$ in. to $\frac{3}{8}$ in., mixed proportion of about 3 to 1. If the of the special aggregate was satis- there was no necessity to add sand. the addition of sand was required it must, of course, be chosen with due regard to colour. In some cases it might be necessary to add a pigment to the cement, or alternatively use a coloured cement where it was essential that the cement should be indistinguishable from the aggregate.

The two varieties of concrete, the facing and the backing, were placed simultaneously, the method adopted being to place thin metal sheets the required distance from the outer shutter. The facing mixture and the ordinary mixture were then placed in position on each side of the metal plate and tamped, when the plates were raised, and a little further tamping bonded the separate mixes together. Chantry Bridge, Rotherham, was carried out on this principle, the specification requiring that the surface concrete should be 2 in. thick, wire brushed, and composed of Mount Sorrel chippings and Bessemer sand. The cost of the facing in this case was 10s. per square yard. As an alternative to the metal plate, wire netting sheets with a very small mesh could be placed between the forms. This would keep the separate mixes apart while being placed, but would allow them to bond with other when tamped. The cost of the treatment varied with the type of aggregate used, whether coloured cements were necessary, and the thickness of surfacing required, but it might be taken as being between 6s. and 10s. per square yard. For scrubbed finish only where no special surface concrete was used, the cost might be taken at about 2s. per square yard, a further cost of 1s. per square yard being entailed, if, after brushing, it was required that the surface should be polished with a carborundum stone.

Other types of finishes included :—coloured washes, either by using the coloured cements now marketed or by adding pigments of the required colour to ordinary Portland cement, and actual colouring of the concrete itself by the use of a coloured cement. Both these methods had to be used with care, particularly where the surfaces to be coloured had a large area, as in some colours it was difficult to obtain a uniform tint. Dalemain Bridge, situated in Dalemain Park, on the main road between Penrith and Ullswater Lake, was satisfactorily constructed in coloured concrete of the same colour as the stonework of Dalemain Hall, which stood immediately behind the bridge. The colouring material was mixed with the ordinary cement by the contractor, and the ultimate result was quite satisfactory. Cement rendering was not generally very satisfactory in this country, the rendering after a few years being inclined to peel off unless the work was exceptionally well done under favourable conditions. An easier and more satisfactory finish, provided the shuttering had stripped well, was simply to wash down the concrete with a cloth and very weak cement wash.

GUILDFORD ELEMENTARY SCHOOL COMPETITION

The awards in this competition are given under Competition News (page 848), and we illustrate the winning design by Mr. George P. Stainsby, A.R.I.B.A., in this issue. Thirty-one designs were submitted.

In his report on the competition the assessor (Mr. Henry W. Allardyce) writes as follows :—

"The plan of the school building in the design No. 10, which I have placed first, is of the open verandah, quadrangle type now in general favour. All the various rooms and offices asked for in the conditions are provided and are compactly, economically, and conveniently arranged on the plan. The position of the girls' and boys' entrances in relation to the hall and the head master's and staff rooms is useful for both school and entertainment purposes and for supervision of the playgrounds, and the plan readily lends itself to division into three separate departments and to future extension. It is probable, however, that the Board of Education may require the practical workroom and the three 40 classrooms to be enlarged, the former to 600 ft. and the latter to 480 ft. super. floor area (*i.e.*, the 12 ft. basis). This can be done without altering the general arrangement of the plan or increasing the length of the quadrangle. An addition of £450 to the estimated cost of the school should cover this enlargement.

"The placing of the lavatory basins in the cloakroom is economical and not objected to by the Board of Education, but if it is intended to lock up the cloakrooms during school hours in order to prevent pilfering, doors or gates will, of course, be required, and it will be found very convenient to provide a separate lavatory compartment. This can also be done without altering the general arrangement of the plan, but would, of course, add slightly to the cost.

"The position of the infants' latrines at the corner of the building is very convenient and for babies essential, and for this reason it might be advisable to interchange the babies' room with the infants' classroom. The Board will no doubt require one of the closets to be partitioned off from the others and a small urinal for the boy infants. Personally, I think it objectionable for direct access to be provided from a playshed into a latrine building, although it is sometimes done.

"The elevations are simple, economical and suitable for a school. The long, continuous windows suggested in the alternative elevations would probably be more expensive than the others. The lay-out of the site plan is in accordance with the conditions, but I suggest consideration be given to placing the school block with its main axis running east and west instead of north and south, as this would facilitate further extension without encroaching further on the playing-fields. Further consideration might be given to the division fencing and gardens indicated.

"The drainage system is shown as a single service, instead of the surface water being kept separate from the soil drains: this can, of course, be easily rectified. The boys' latrine is not shown in detail, but, judging by the overall size on the lay-out plan, the urinals will be kept separate from the w.c.'s.

"With reard to the estimate of cost. I consider the author's estimate for this design No. 10 is much too low, as, after cubing up the school buildings, I find his figure of £7.560 works out at only about 10d. per cubic foot, whereas I think it should be 1s. As the other items are also low I give for the purpose of comparison the figures of the author's estimate and my own in parallel columns :-

	Author's estimate.	Assessor's approximate estimate.
	£	£
School building ...	7.560	9.200
Latrines, playshed and drainage	750	1.250
Caretaker's house ...	450	600
*Boundary fencing ...	250	950
*Tar-paving, including new pathway ...	200	350
*Levelling and preparing playing-field ...	750	750
Architect's charges, etc.	600	
	£10.560	1.280
Quantity surveyor, printing and clerk of works	500	
	£11.060	£14.380

"*The items of fencing, tar-paving and levelling and seeding playing-field vary very much in most of the competitors' estimates. In placing this design first I have not overlooked the discrepancies between the author's estimate and my own, but, in my opinion, there is no other design submitted of equal merit apart from cost, and no design of equal merit that could be built at as low a cost as this design could."

WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

The Slum Problem.

Sir K. Wood informed Mr. E. Brown that the total sum paid on account by Exchequer subsidy towards the cost of slum clearances since April 1, 1924 was £103,000.

Mr. E. Brown asked whether the Minister of Health could give figures to show the effect, if any, of the building of new houses since January 1, 1919, on reducing overcrowding in the slum areas of our great cities.

Sir K. Wood said that the figures desired were not available, but it was obvious that the large numbers of new houses which had been erected since the Armistice must have contributed very largely to the relief of overcrowding, including overcrowding in slum areas.

Mr. Gillett asked the Minister if he would state the number of persons it was proposed to displace in connection with the slum clearance scheme in the borough of Finsbury, and whether provision would be made for rehousing those so displaced within the borough.

Sir K. Wood said that 205 persons would be displaced in connection with the Metropolitan Borough of Finsbury (White Horse-alley) Reconstruction Scheme, 1926, and rehousing accommodation for this number was being provided by the Borough Council in flats which were in course of erection at Mantell-street within the borough.

Mr. Tasker asked the Minister of Health whether he was aware that the London County Council, acting under the Housing Acts, 1890 to 1919, the County of London (Hickman's Folly Improvements Scheme) Order, 1923, had taken possession of certain properties known as Nos. 16 and 20, Hickman's Folly, Nos. 1 to 6 (inclusive), Hickman's-court, and Nos. 1 to 4 (inclusive), Oliver Twist-court, notwithstanding that the decision of the arbitrator as to the amount of compensation payable by the Council to the owner whose property had been thus forcibly acquired had not been given, and whether he had given his consent to the action of the Council.

Sir K. Wood replied that section 106 (1) of the Housing Act, 1925, gave powers to local authorities to enter on land included in a confirmed improvement scheme without the Minister's consent, and it was understood that the London County Council had taken possession of the property in question under the powers conferred upon them by this section.

Smoke Abatement.

Mr. R. Wilson asked the Minister of Health whether he could make any statement as to the working of the Smoke Abatement Act.

Sir K. Wood said that the Act came into force only on July 1 last. By-laws as to the emission of black smoke had been approved for a number of authorities. Some Regional Advisory Committees had been set up. A draft order extending the Alkali Acts had been prepared and considered with representative bodies and the statutory inquiry would be held next month.

Limits for Subsidy.

Mr. Hore-Belisha asked the Minister of Health whether, seeing that the price of a Council house ranged from as low as £300 to £500 and more in various localities, he could explain this difference, making allowance for local conditions and site, sewerage, and water factors.

Mr. Chamberlain said that the prescribed limits of area for subsidy houses ranged from 550 to 950 superficial feet, and variation in size therefore necessarily accounted for a large part of the difference in price. In addition to this and the other factors mentioned, a variation in building costs in different districts, and in standards of accommodation and amenity were contributory factors to the difference in range of prices in various localities, and the matter was, of course, influenced by the extent of the demand on the building industry in any area.

New Bill.

Sir R. Gower has introduced a bill to amend the provisions in Part II. of the Housing Act, 1925, relating to improvement and reconstruction schemes. The measure has been read a first time.

Rural Housing.

Mr. Chamberlain informed Mr. Everard that the county councils in England and Wales who had not submitted schemes under the Housing (Rural Workers) Act, 1926, were as follows:—Berkshire, Buckingham, Cambridge, Cornwall, Durham, Glamorgan, Hertford, Isle of Ely, Isle of Wight, Lincoln, (Kesteven), Merioneth, Norfolk, Radnor, Shropshire, Soke of Peterborough, Warwick. In some of these cases it was hoped that schemes would shortly be submitted, but in others the councils of the county districts had been declared the authorities for the purposes of the Act.

Direct Labour Costs.

Mr. Robinson asked whether the Office of Works was engaged on the building of houses in any district or for any other department by direct labour; if so, what was the cost per cubic foot; and whether the Office of Works still administered any cottage property, the district where it was situated, and the rent charged for cottages of two, three, four, and five rooms respectively.

Sir V. Henderson said that the answer to the first part of the question was in the negative; the second part did not, therefore, arise. Particulars of the rents charged for houses on the several housing estates administered by the Office of Works showed that the accommodation generally consisted of four or five rooms. In addition to these houses, a few cottages occasionally became available for letting on coastguard stations scattered over the country, the rents of which varied according to the accommodation provided and to local conditions.

Particulars of rents charged for houses on the housing estates administered by H.M. Office of Works:—

Estate.	No. of houses.	Rent per week.
England.		
Dudley (temporary) ..	301	*5s. 10d. to 7s. 6d.
Barrow-Roosegate (temporary	134	*4s. to 6s. 3d.

Charing Cross Bridge.

Col. Ashley, the Minister of Transport, replying to Sir W. Davison, said the committee of engineers charged with the investigation of the scheme of the Royal Commission for a double-decker road and railway bridge at Charing Cross would not be in a position to report before next spring.

The London Squares.

Lord Londonderry again presided over a meeting of the Royal Commission on London Squares, held last Tuesday.

Sir Willoughby Dickinson, on behalf of the London Council of Social Service, said that experience had shown him how difficult it was even for a group of householders interested in the preservation of a square, to bring their legal rights to the test of a court of justice. This was one reason why Parliament should deal with the question. Otherwise, it was probable that even squares were legally protected might be lost, b there was no one who would run the testing the question. In fact, all tha needed by a builder was to buy up the of a few residents and then proceed t with practical assurance that no one contest his actions. That was what ha pened in the case of Mornington-cresce Endsleigh-gardens. Both those cases to have been subjected to legal inqui the case of part of Euston-square, th would undoubtedly have been built on not been for the accident that the came before Parliament, and that the had a chance of objecting. Similarly, wick-square had been spared by the fa the promoters of the scheme for Covent Garden Market had to apply t hament for that purpose. Unless Parl intervened now, it was by no means i able that the squares of London would ally be absorbed, even in cases wher had been Acts of Parliament passed t late their use.

Two suggestions had been put forw dealing with the problem. The first w the local authorities should be author purchase the freehold of the gardens tain defined terms of pavment, and them in their present state or throw open to the public where that seemed able. The other proposal was that the should be permanently retained as g and be used for no other purposes. first of these suggestions was open to tion. Any proposal to devote these to the public would rouse the opposi householders all over London who n joyed them. Also, in many instan would be difficult to transfer the them from private persons to the and, further, if the local authorities obliged to pay large sums of money t to secure the land as an open spac would not do it. The main object prevent building, and if that were the future transfer of the land for purposes might be left for Parliament cide when the circumstances deman The requirements of the case would quately met by an Act of Parliame merely sterilised in the future these lar plots of ground.

Sir Edgar Bonham Carter, giving on behalf of the Commons and F Preservation Society, the Garden Cit Town Planning Association, the Society, and other bodies, said that, opinion, the essential object was the r tion of the square gardens unde present conditions—that was, that hold should continue vested in the owners, and the gardens should con private open spaces as the common ar the houses which now had rights ov The preservation of the squares aspect of the town-planning problem practical and fair method of preservi was to be found in the application planning principles to built-up areas legislation applying town-planning p to built-up areas would be nugatory was accompanied by a provision givi lar stability to the existing lay-out town as it would have if it had it laid out under the Town-Planning A

Legislation should provide that the squares and similar open spaces mus served as private open spaces. It wo guard the landowners' right to the and the tenant's rights over such squ open spaces.

In order to enable the present la be improved, it would be reasonabl power to the L.C.C. under proper s and with the sanction of the Mi Health to consent to an exchange of ing garden for an equal or greater a vided that the land dedicated in was appropriated as a private or pu space. Landowners should be auth they wished, subject to the right residents in the squares, to hand management and maintenance of th to a local authority.

HE LONDON BUILDING ACTS AND THEIR APPLICATION—XXXV

By H. V. MILNES EMERSON, A.R.I.B.A.

218 completes the 1894 Act. There schedules in conjunction with the first schedule relates to the con- of walls of brick, stone, etc., and d schedule deals with fire-resisting The third schedule fixes the fees district surveyors, and the fourth gives a list of previous Acts wholly repealed. These schedules have ed with the sections of the Act to y relate.

he 1894 Act, the following supple- Acts have been made :—

ndon Building Act, 1894 (Amend- . 1898.

Government Act, 1899.

and Workshop Act, 1901.

ondon County Council (General Act, 1902 (dealing with exits in odging-houses, etc.).

and Workshop Act, 1907.

ndon Building Acts (Amendment)

ondon County Council (General Act, 1908.

ondon County Council (General ct, 1909.

, Town Planning, etc., Act, 1909.

London (Various Powers) Act, 1911.

on (Administrative Provisions) Act,

tropolitan Water Board Act, 1913.

ondon County Council (General Act, 1915, 1920, 1921 and 1923.

vn Planning Act, 1925.

endment Act of 1898, section 3, ction 14 of the 1894 Act, rendered by the decision L.C.C. *v.* Aylesbury (1898), 77 L.T. 440.

4.—This section is an amendment on 5 of section 13, 1894 Act, and at no dwelling-house outside the be erected within 20 ft. of the he roadway.

5.—This section takes the place of 3 of the 1894 Act, relating to the a notice, summons or order in the gerous or neglected structures, and ed necessary owing to the decision the case of Reg *v.* Mead (1898), 2.

6.—This is an amendment of sec- (Offences against the Act), sub- e) of the 1894 Act. The original th the words added by this section now reads as follows :—

up, erects, *retains* or adapts any structure to which Part VII of plies without having obtained any or licence required by that Part t, or makes default in observing e conditions contained in such or licence (shall be liable to a £20 a day, etc.).

ion was altered as above owing to n of Reg. *v.* Cluer (1897), 77 L.T.

7.—Section 200, subsection 3, the £20 a day, etc., quoted in the last brackets, is amended to a penalty ding £2 for each offence, and a t exceeding £20 a day during the n of the offence.

don Building Acts (Amendment) chiefly deals with means of escape

6 of this Act defines expressions sections 7 to 14 (inclusive) deal s of escape from new and old These sections have been dealt onnection with the repealed sec- bsection 2, and 63 of the 1894 Act.

don Government Act, 1899.

5 of this Act provides for the certain powers and duties from County Council to each Borough Council as respects their Borough. The following are the powers transferred :—

Power, under section 84 of the London Building Act, 1894, to license the setting-up of wooden structures, and power to take proceedings for default in obtaining or observing the conditions of a licence under that section.

Power, under section 134 of the same Act, relating to the removal of unauthorised sky-signs.

Power, under section 199 of the same Act, relating to the removal of obstructions in streets

Power, under section 170 of the same Act, relating to the demolition of buildings in case of the conviction for an offence against the Act, or by-laws made under it, providing that the Borough Council concerned have obtained the conviction.

Power to take proceedings in respect of timber or other articles piled, stacked or stored in contravention of sections 197 and 200 (11) (*k*) of the same Act, such power only to be exercised within the borough.

The Factory and Workshop Act, 1901 and 1907, deal with means of escape from fire, etc., and the regulations of the L.C.C. dealing with same have been quoted.

Since 1905, amendments to the London Building Acts have been obtained by the London County Council under a General Powers Act, and not by a separate Building Act.

The first amendment to the London Building Act of 1894 under this method was contained in Part III of the London County Council (General Powers) Act, 1908. This Act repealed sections 75, 76 and 77 of the 1894 Act, and provided new regulations for the cubical extent of buildings, etc., which have been dealt with in these articles under the repealed sections 75, etc., of the 1894 Act.

The London County Council (General Powers) Act, 1909, Part IV, makes provision with respect to buildings of iron and steel skeleton construction, and as to use of reinforced concrete.

SECTION 21.—In addition to the meaning assigned to words and expressions in the previous Acts, the following are introduced :—

For the purposes of this Part of this Act the expression "pillar" shall, unless otherwise stated, mean a metal pillar, and shall include all columns and stanchions or an assemblage of columns or stanchions properly riveted or bolted together; and the expression "girder" shall mean a metal girder or joist; and the expression "Tribunal of Appeal" means the Tribunal of Appeal as constituted by this part of this Act.

Note.—For the purposes of this part of the London Building Acts, the Tribunal of Appeal consists of an additional member appointed by the Council of the Institution of Civil Engineers.

SECTION 22, together with the subsections, is the main section of the Act, and is as follows :—

Notwithstanding anything contained in the principal Acts requiring buildings to be enclosed with walls of the thickness and of the materials therein respectively described, it shall be lawful to erect, subject to the provisions of this section, buildings wherein the loads and stresses are transmitted through each story to the foundations by a skeleton framework of metal or partly by a skeleton framework of metal and partly by a party wall, but buildings so erected shall (subject to any exemptions contained in the principal Acts or any of them) be subject to and comply with all such provisions of the principal Acts or any of them, and any by-laws in force thereunder as may not be inconsistent with or contrary to the provisions of this section.

The following are briefly the provisions that apply in respect to the construction of the skeleton framework, foundations, walls, floors, staircases, and other parts of the structure of such buildings :—

All rolled steel must comply with the latest British Standard specification. The skeleton frame and party walls must be capable of sustaining safely the whole dead load and superimposed load. The pillars in external walls and girders must be encased with incombustible material at least 4 in. thick, but the underside of girders, edges of flanges, plates and angles can be covered with incombustible material 2 in. thick, and all internal pillars and girders are to be encased to the satisfaction of the District Surveyor with not less than 2 in. of brickwork, terra-cotta, concrete, metal lathing and plaster or cement. The upper surface of girder flanges and the lower surface of subsidiary joists can have a casing 1 in. thick.

Wood firring must not be used in any casing. In buildings of one story, and not more than 25 ft. high, the casing to pillars and girders can be omitted.

Girders must not exceed a span of more than 24 times the depth of the girder unless the deflection of the girder is less than one four-hundredth part of the span. Two or more girders acting together must have separators not exceeding five times the depth of the girder apart, and separators immediately over all supports and under all concentrated loads. The girders supporting external walls must be placed at the floor level of a story, or at a distance of not more than 5 ft. above or below such floor level. Rivets must be used in all cases where reasonable, and although bolts are often used in fixing the steelwork together on the job, the framework is much better riveted together. Bolts, where used, must extend through the full thickness of the nuts attached thereto, and the nuts must be secured to prevent them becoming loose.

External walls for the top 20 ft. to be not less than 8½ in. and below the 20 ft. to be not less than 13 in., providing that the length and height of the wall between the supporting framework does not exceed the provisions of the first schedule of the 1894 Act, otherwise the external wall must be in accordance with that schedule. The provisions of the schedule are as follows :—Where the wall does not exceed 25 ft. in height (whatever its length) it shall be 13 in. thick at its base.

Where the wall exceeds 25 ft. but does not exceed 30 ft. in height and does not exceed 45 ft. in length it shall be 13 in. at its base.

Where the wall exceeds 30 ft. but does not exceed 40 ft. in height and does not exceed 35 ft. in length it shall be 13 in. at its base.

Party walls must be in accordance with the provisions of the principal Act. All brickwork, terra cotta, etc., must be built in Portland cement mortar, the Portland cement to conform with the latest British Standard specification. Party and other internal walls not carrying weights or surrounding steelwork can be in lime mortar.

Plates and bars used in pillars must not be less than ¼ in. thick. Hollow pillars are to be filled with concrete or properly sealed at both ends with riveted metal plate. Cast iron pillars are to be not less than 5 in. wide, and the thickness of the metal to be ¾ in. or one-twelfth of the least width of the pillar, whichever is the greater. The cap and base to be part of the pillar or connected with a properly turned and bored joint. The pillar to be fixed to the girder with not less than four bolts of not less diameter than the least thickness of the metal in the pillar. If more than four bolts are used the diameter can be reduced in proportion, but not below ¾ in. diameter per bolt. The area of the base of each pillar must be sufficient properly to distribute the load upon the foundations and properly bedded to transmit the load uniformly, whilst the stress in any metal interposed between the ends of a superimposed pillar and a pillar beneath must not exceed the stress on the superimposed pillar.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Subsidy Question.

[REPLY TO C.O.W., NOVEMBER 18.]

SIR,—The local authority is quite justified in refusing to grant a subsidy on the grounds that all operatives' time must be reckoned in the value. Your correspondent will readily see what abuses could enter into the building of subsidised houses under any other circumstances. For instance, a group of operatives could combine to build a house without wages, and so render only the cost of materials as the cost of the house. In this way a house of about £1,300 value would be eligible for the subsidy, which, as Euclid says, is absurd. R. A. A.

Recovery of Fees.

[REPLY TO "NON-MEMBER," NOV. 18.]

SIR,—The rule is that if there is a contract between the employer and his architect for the latter to perform an entire or whole work to conclusion, then, unless payment by instalments is provided for, nothing is payable to the architect until the whole work is completed. If, however, there is no special contract, as appears in this instance, then "Non-Member" can recover from time to time for work he has done in preparing drawings, etc., and obtaining tenders for the postponed work a "reasonable" remuneration, and should be successful. He could, of course, put forward the R.I.B.A. scale of fees, even though he is a non-member. They are not binding on an employer and have not always been accepted by the Court, but nevertheless have been held to be "reasonable" on many occasions. (See Chapter XIV, "Creswell on Building Contracts."). T.

Measuring of Sub-Contractor's Work.

[REPLY TO MEASURER, NOVEMBER 18.]

SIR,—The work in question being pavings, there is no question about its accessibility for re-measurement. The only work in which it is necessary for surveyor and contractor to measure together and agree is work which is to be covered up. In other cases it is only a matter of doing things in the convenient way. If the contractor in this case disagrees with the measurements, they are there for him to check. I do not see that he has any right to make the claims described, but one thing is certain, viz., that the surveyor has the right to all measurements and rates.

SURVEYOR.

Overhanging Guttering.

[REPLY TO "ROSS," NOVEMBER 18.]

SIR,—Presumably the land purchased is vacant land; and it is the boarding and guttering on the adjoining owner's property that overhangs the said vacant land. If this be so, and the property concerned is outside the Metropolis, then unless the adjoining owner can prove his right to an "easement" in respect to the gutter overhanging, "Ross" can call upon the former to remove it altogether and no liability anent it attaches to the latter. If, however, an "easement" does in fact exist, then "Ross" should make the best terms possible with the adjoining owner, which may, however, end in his having to carry out the work he describes to the full. In the Metropolis, under the London Building Act, 1894, he would be compelled to do the work described whether there is an existing "easement" or not.

But "Ross" does not put his question clearly. It may be that it is the boarding and guttering on his own building that overhangs the property of the adjoining owner. In this case, if he wishes to go higher than the adjoining property he must carry out the work described effectually to get rid of the rainwater of the lower premises—unless some other cheaper means can be devised. He must get the rainwater away so as to cause no nuisance to the adjoining owner. C.

Zinc Roof and District Surveyor.

[REPLY TO "PRACTICE," NOVEMBER 18.]

SIR,—Will "Practice" explain what he means by "repair" in the second paragraph of his reply, in your issue for November 18, to "Zinc's" question in *The Builder* of November 11, apart from any dangerous condition of a structure? I have in mind that certain materials are specified for the construction of walls, encasement of the steelwork of framed buildings, covering of roofs, etc. These are materials that must be used, as against others not scheduled.

Would a district surveyor be expected to survey buildings, as in "Zinc's" case, where a roof is to be wholly re-covered, keeping in view the point that a roof covering is a most necessary part of the construction of a completed building? DOUBTFUL.

Public or Private Road?

[REPLY TO "SURREY," NOVEMBER 25.]

SIR,—Under section 4 of the Public Health Act, 1875, "Street" is defined to include, if not inconsistent with the context, *inter alia*, "any passage, whether a thoroughfare or not," and in Walthamstow U.D.C. v. Sandell (1904), 68 J.P. 509, a passage opening from a highway and used as a means of access to the back premises of five houses, and forming a *cul-de-sac*, was held to be a "street" within section 150 of the Act. Similarly "street" in the Private Street Works Act, 1892, has a like significance to that which it has in section 150 of the Public Health Act, 1875, and includes a *cul-de-sac*.

Now, it is immaterial in the case of a "street" whether there is a thoroughfare or not. In the instance referred to in the question, there is, of course, admittedly access at one end from a main street; and, indeed, by user, it would appear that there is now access from both ends.

Under section 150 of the Public Health Act, 1875, an urban authority has power to compel the "making up" of private streets, and to "take them over" as highways under section 152. The like applies in a rural district, if the section has been put in force under an order of the Minister of Health, but the section does not apply in a district in which the Private Street Works Act, 1892, has been adopted; though, as previously pointed out, sections 6 and 19 of the last-named Act contain similar provisions as to the "making up" and "taking over" of streets. It follows, therefore, that a rural district council can "take over and make up" the *cul-de-sac* referred to.

In general, the local authority concerned prepares the plans and specification for the work, which must satisfy their requirements. In this matter, it would appear, the authority has much latitude, and, indeed, no two authorities agree as to what the extent the standard of requirements should be. However, under both Acts there is ample opportunity afforded to frontagers for making objections, and for putting forward alternative suggestions which should reasonably satisfy the authority. In the case under review, it might be put that the way "leads to nowhere," and that it is not subject to "much and through traffic," and that the requirements are excessive. However, in all these questions "Surrey" would do well to be legally advised before proceeding. LAW.

Thistles.

SIR,—Can anyone suggest an effective and not too expensive method of ridding a large field of thistles? It is feared that during next autumn the thistledown will be blown and self-sown in the gardens of houses which are being erected in close proximity.

"NEIGHBOURLY."

Exterior Treatment for Bungalow

[REPLY TO G. G., NOVEMBER]

SIR,—(1) Your correspondent will greatest difficulty in killing the creos when ultimately painted, the cost tenance will be considerable. I sho gest battening the walls and lati cement rough-casting, as the wise in the long run.

(2) The trouble points to absence course. Strip the bottom three feet tering, and render in waterproofed Waterproofing solutions are genera effective when combined with cem when used as a surface treatment. T

Iron or Lead Pipes.

[REPLY TO F. L., NOVEMBER 1

SIR,—This is generally regulated local water authority, who should sulted. Much depends on the natu water supplied. N

Floor Covering Composition

[REPLY TO BM/FAW4, NOVEMBE

SIR,—Surely the best way will be new ¾-in. deal grooved and tongue on top of the old boards. Almost positions would crack on top of boarded floor.

Flooring Preparation.

[REPLY TO ANXIOUS, NOVEMBE

SIR,—Boarding laid direct on should be bedded in tar mastic and on the underside. P

Electricity or Crude Oil.

SIR,—We are thinking of putting new crude-oil cold-starting engine or electric power to run our machin works. The cost of electricity per u be 2¾d. The running costs for would be .55 lb. per b.h.p. hour. An engine will do all the necessary work Which is the cheaper proposition of WM. SHARP

Timber Mark.

SIR,—Can you tell me the port of boarding marked in red KA $\frac{W}{JA}$ also what quality this implies? No

HOUSING.

The following questions on th position have been asked and an Parliament:—

Empty Houses.

Mr. T. Thomson asked the M Health if he was aware that a lar of dwelling-houses were kept e withheld from occupation on acco owners wanting to obtain a h price, and would he take steps this.

Sir K. Wood said that the was aware that there was always number of unoccupied houses w held for sale, but he did not co it would be practicable to legisl subject.

Rural Housing.

In reply to Mr. T. Williams, berlain said that at October 1 last date for which returns were av number of dwellings in respect of plications for assistance had been local authorities under the Hou Workers) Act, 1926, was 271. had been promised in respect of 3 and on 15 dwellings work had be

Houses under Constructi

Mr. Chamberlain informed M that the total number of house of erection under the Acts of 191 1924 on May 1, 1927, was 117, ticulars relating to November 1, not yet available, but the co number at October 1, 1927, was

THE BUILDING TRADE

NTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—VI.

in our last article endeavoured to me of the principles which the law options to purchase or renew as in agreements and leases it now ains to refer to a few recent cases effect of options is illustrated, and tion with the last case we cited *v.* Murphy (1926, A.C., 63; *The* November 27, 1925), Hollies Stores s (1921, 2 Ch., 202; *The Builder,* 25, 1921), should be referred to he terms of the option to call for lease contained a provision some- nilar to the agreement made in *v.* Murphy. Premises were leased aintiff company in 1914 for a term years, and the company and three named in the lease jointly and covenanted for payment of the rent. contained an option that if the sired to take the premises for a erm of seven years and gave six months' notice of their intention to further lease should be granted ease to contain clauses so far as dentical with the terms thereof, in- he covenant for payment of rent served." One of the persons named tors had died in 1917 and in 1920 the died. Six calendar months before ation of the lease the company or a further lease and offered to her guarantor or to make a deposit nt or even to pay the seven years' lvance, but the personal representa- he lessor refused to grant a further an action for specific performance reement brought by the company held that the effect of the agree- that the new lease was to contain entical so far as possible with those isting lease and that one of those was the covenant by the three arantors to pay the rent and that g become incapable of performance rds could not be compellel to grant lease even though the rent were ell secured.

in *v.* Newman (1906, 2 K.B., 167; *der,* September 15, 1906), under an of tenancy, a tenant entered into of premises " for a period of twelve ith the option of a lease after the ime at a rental of £30 per annum." period of twelve months had ex- landlord demanded possession at f that period. A Divisional Court under this agreement the tenant ht to claim a lease for a further at least one year after the expira- e first twelve months, and one of s expressed the opinion that under n very possibly the tenant could ed a lease for his life.

se should, however, be considered ght of a decision in the Court of Gray *v.* Speyer (1922, 2 Ch., 22; *der,* April 21, 1922). There the vas the lessee of a house under a ring in 1975, and he let a portion use to the defendant for one year ch 25, 1917, with an option to con- another two years from March 25. giving the landlord two months' is intention so to continue. When ame to exercise the option the de- roposed to continue for one year an option to continue for a further this was agreed to, but in January, re the year had expired the parties the following agreement—that the ercised his option to continue the ntil March, 1920, and that the land- ed the tenant the option to continue cy after March, 1920, from year to year provided he gave one month's notice of his intention to continue, but that in the event of his desiring to put an end to the agreement he should give two months' notice. In August, 1920, the plaintiff had acquired the head lease and on September 21, 1920, he gave the defendant notice to quit on the following Lady Day, but the defendant disputed the plaintiff's right to give this notice and gave the plaintiff notice of his intention to exercise the option to continue the tenancy for another year. In this action the plaintiff claimed a declaration that the defendant was not entitled to a perpetual right of renewal and that the notice to quit was effective to determine the tenancy on March 25, 1921, whilst the tenant counterclaimed for a declaration that he held as tenant from year to year with the right of perpetual renewal during the term of the head lease. The plaintiff did not claim possession, his notice to quit not having expired, and the defendant did not claim specific performance, so the judgment could only be declaratory. The Court below had held that under this agreement the option when once exercised created a tenancy from year to year with the ordinary incidents and that the option to perpetual renewal was repugnant to such a tenancy and must be rejected—(see on this point our fifth article)—but the Court of Appeal held that the true effect of the agreement was not to create a tenancy from year to year but to extend the option to continue, at its date limited to one year, to a succession of reversionary terms each for one year certain, provided the requisite notice was given before the expiration of each succeeding term, but that such an agreement not being under seal as required by 8 & 9 Vic. c. 106 was void and both the claim and counterclaim were dismissed.

It is not clear under this decision what the position of the parties would be; there is, however, a note to the report that at the hearing of the appeal it appeared that the plaintiff had accepted rent from the defendant for a period after the expiration of the notice to quit, and presumably this accounted for the fact that the claim for a declaration that the notice to quit would be valid was also dismissed.

It may be convenient here to refer to a case where there was no question of any necessity for a deed, the agreement being for less than three years, but where the question was whether an unsigned agreement to let a house which contained an option could be enforced by a decree of specific performance. In this case, Brough *v.* Nettleton (1921, 2 Ch. 25), the defendant, a builder, had verbally agreed to let a house to the plaintiff for 2½ years from October 1, 1917, at the yearly rent of £37 10s. with an option to the plaintiff of purchasing the house for £500 at any time during the tenancy on giving notice of his intention so to do. The next day the plaintiff had called at the defendant's office and had given the clerk-in-charge (who, however, had no authority to grant leases) the terms of the above verbal agreement, who had filled them into a printed form used by the defendant where the lease exceeded three years, but including the option. The plaintiff signed this form, but it was not signed by the defendant. The plaintiff entered into possession and on December 30, 1919, he wrote to the defendant exercising the option. The defendant then denied that any such agreement had been entered into, but alleged that he had only let the house to the plaintiff at a yearly tenancy. The plaintiff brought this action for specific performance of the parol agreement and the Court, accepting the plaintiff's statement of the facts, held that the taking possession was a part performance within the Statute of Frauds, which entitled the plaintiff to give evidence of the entire parol agreement, including the option, and a decree for specific performance was granted.

It was held in Hand *v.* Hall (1877, 2 Ex. Div., 355) that a lease for less than three years need not be under seal under 8 & 9 Vic. c. 106, merely because it contains an option by which the term may be extended beyond three years. The Statute of Frauds requires leases for more than three years to be in writing, and 8 & 9 Vic. c. 106, section 3, required such leases to be by deed. (See new section 52, Fraud of Property Act, 1925.)

In Stewart *v.* Massett (Weekly Notes, 1924, 267; *The Builder,* November 28, 1924), by a lease dated June 12, 1912, for a term of 21 years from Lady Day, 1910, at a rent which increased at each period of 7 years, there was a proviso that the tenancy should be determinable at the end of the first seven or fourteen years by either party giving to the other six calendar months' previous notice in writing, but there was a further proviso that if the lessee should be desirous of having a further lease for a term of seven years and should give the lessor six calendar months' notice of such desire before the expiration of the term of 21 years, then a further term would be granted, the lease to be in the same form with such modifications as the lessor's solicitor might approve. On August 20, 1923, the lessee by letter purported to exercise this option for a further lease, but the plaintiff (in whom the reversion had become vested) declined to grant a further lease, and acting in pursuance of the terms of the lease gave the tenant notice to quit on Lady Day, 1924, that is to say, at the end of the first 14-year period. On an application for a declaration the Court held that the option only came into operation if the lease continued without either party having determined it, into the third and last period of 7 years.

We may note here that where under a tenancy agreement it was agreed that the rent should be paid quarterly in advance but an option was given to the tenant to purchase the lessor's interest in the house provided that the tenant should " in the meantime have duly paid the said rent hereby reserved" and the tenant had delayed paying the rent due December 25, 1907, until January 10, 1908, and then on March 20, 1908 had exercised the option, it was held that "duly" did not mean " punctually " and the condition precedent to the exercise of the option had been fulfilled (Starkey *v.* Barton, 1909, 1 Ch. 284).

We may conclude this article by referring to another case which shows the care which should be exercised in framing options and putting them into operation. In Fowler *v.* Willis (1922, 2 Ch., 514; *The Builder,* June 30, 1922), by deed dated April 15, 1920, the defendants demised to the plaintiffs certain premises for a term of three years, and by the lease it was provided that the plaintiffs should " have the option of purchasing all the estate interest and title which is at this the date of these presents vested in the landlords in and to the freehold premises hereby demised, at a price not exceeding £3,000."

By a letter dated April 15, 1921, the plaintiffs exercised this option, and forwarded a deposit. The plaintiffs subsequently learned from the abstract of title that there was a mortgage on the property for £500, and they required the defendants to perfect their title by redeeming the mortgage. The landlords declined to do this and contended that the contract created by the option was for the purchase of the property subject to the existing mortgage, but they offered to release the plaintiffs.

The matter came before the Court for a declaration and the Court held that the matter really turned on two questions.

First, what was "the estate interest and title" of the mortgagees, and, secondly, what was the estate interest and title of the landlords? The answer to the first question was that it was the legal fee simple subject to the landlord's equity of redemption. The answer to the second question was that the landlord's estate interest and title was the equity of redemption. Therefore as the option was for the purchase of "all the estate interest and title" which was vested in the landlord at the date of the lease (the mortgage deed was dated February 22, 1910), the result of its exercise was that the plaintiffs had agreed to purchase the equity of redemption subject to the mortgage. As the tenants were not desirous of being relieved of the contract a declaration was made that there was a valid contract for the sale of the equity of redemption and a decree for specific performance. Of course, under such circumstances no decree would have been made against unwilling purchasers, but to avoid litigation the case shows that in exercising options to purchase it is well to secure in the lease that the property shall be sold unencumbered.

LEAD PAINT (PROTECTION AGAINST POISONING) ACT 1926

THE following order, dated November 14, 1927, has been made by the Secretary of State under Section 2 of the Lead Paint (Protection against Poisoning) Act, 1926, in respect of the employment of young persons as apprentices in the painting trade, and of women and young persons in work of decorative design:—

In pursuance of the powers conferred by Section 2 (Prohibition of employment of women and young persons in painting buildings with lead paint) of the Lead Paint (Protection against Poisoning) Act, 1926, I hereby make the following order:—

(a) The said Section shall not apply in the case of any male young person employed as an apprentice in the painting trade if he is employed under an indenture of apprenticeship or under an established custom of regular apprenticeship, and if his name, age, and the date on which he was first engaged as an apprentice, are entered in a separate list attached to the register of persons employed which the employer is required to keep under Section 4 of the said Act.

(b) The following special decorative work shall be excluded from the provisions of the said Section, namely, the execution of wall or ceiling paintings, or any similar work of decorative design.

Nothing in this Order shall be deemed to relieve any employer from any of the obligations imposed by Section 2 (Regulations for employment of women and young persons in processes involving the use of lead compounds) of the Women and Young Persons (Employment in Lead Processes) Act, 1920.

Manchester Museum Extension.

Lord Crawford and Balcarres, Chancellor of the University, presided on Monday at the opening of a new extension of the buildings of the Manchester Museum, which form a part of the University block and, like the institution itself, are held on trust by the University for public purposes.

University College, Nottingham.

The Mayor of Nottingham (Alderman E. Huntsman) has received an official intimation that H.M. the King has consented to open the new buildings of University College, Nottingham, given by Sir Jesse Boot. The University buildings, when complete, will, with the park in which they are situated, the playing-fields, and the road, a mile and a quarter long, known as University Boulevard, have cost Sir Jesse Boot over £500,000. Mr. P. Morley Horder is the architect.

NEW BUILDINGS IN LONDON

Aldwych.—Messrs. John Mowlem & Co., Ltd., Ebury-bridge-road, S.W.1, have received the contract for the foundations of the new west wing of Bush House, W.C. Messrs. Moreland, Hayne & Co., Ltd., 80, Goswell-road, E.C.1, will supply the whole of the steel framework. Messrs. Helmle, Corbett & Harrison, Bush House, W.C.2, are the architects.

Barnes.—SCHOOL.—The London County Council has recommended, subject to the consent of the Minister of Health, the freehold of a site at Castelnau estate, having an area of about 2.43 acres, with a frontage of about 458 ft. to Stillingfleet-road, be sold to the Surrey Education Committee for the erection of an elementary school.

Chelsea.—Old property in King-street is being pulled down preparatory to the erection of a row of shops, with flats above. The architect is Mr. C. H. Roberts, A.R.I.B.A., 58, Frith-street, W.1.

Coulsdon. — HOUSES. — Messrs. Thomas & Son, builders, of Bramley-avenue, are to erect 44 houses in Biggin Wood-road.

Croydon.—HOUSES.—The Croydon Borough Council are about to invite tenders for the erection of 96 houses on the Mitcham-road housing estate.

Croydon.—HOUSES.—Messrs. Parish, Tyler & Crump are to erect 33 houses in Shirley-avenue.

Croydon.—HOUSES.—The Croydon Borough of Southend-on-Sea, has secured the contract for the erection of two blocks of flats in Upper Coombe-street, Croydon, for the local Council. The tender price is £16,143.

Downham.—SCHOOL.—The London County Council are to erect an open-air school on a site at Downham, Lewisham.

Edmonton. — HOUSES. — Messrs. Howis & Belcham, architects, 77, Chancery-lane, W.C.2, have prepared plans for Mr. A. W. Jones, for the erection of 42 houses in Bounces-road and Montagu-road.

Exhibition-road.—The Royal Geographical Society are to sell 40,000 square feet of land on the Lowther Estate in Exhibition-road, S.W., for the erection of a large block of residential flats. Plans have been prepared by Messrs. T. P. Bennett & Son, FF.R.I.B.A., 41, Bedford-row, W.C.1.

King William-street.—Plans have been prepared for the erection of a large block of business premises on a site at No. 40, King William-street, E.C. 4. The architects are Messrs. M. E. & O. H. Collins, 115, Old Broad-street, E.C. 2.

Lewisham. — HOUSES. — The Lewisham Borough Council are inviting tenders for the erection of 102 houses and 112 flats on the Lewisham Grove-park housing site. Mr. W. R. Davidge, F.R.I.B.A., of 5, Victoria-street, S.W.1, is the architect.

Ludgate Hill.—Extensive premises at No. 2, Ludgate Hill, E.C. 4, are to be vacated shortly for conversion into branch offices for the National Provincial Bank, Ltd.

Newington Butts.—Large branch bank premises are to be erected upon the site of Nos. 39-41, Newington Butts, S.E.1, for the Midland Bank, Ltd. Plans have been prepared by Messrs. Whinney, Son & Austen Hall, 8, Old Jewry, E.C.2.

Paddington.—ADDITIONS.—Mr. Herbert A. Welch, F.R.I.B.A., of 7, New-square, Lincoln's Inn, W.C., has prepared for alterations and additions, No. 31, Cambridge-place, and the adjoining premises in Norfolk Mews East

Poplar.—PREMISES.—The Poplar Borough Council has approved plans submitted by the London Co-operative Society, Ltd., Whitta-road, Capel-road, Manor Park, E.12, for building and drainage of 270, High-street, Poplar, E.14.

Richmond.—Large showroom premises are to be built in George-street for Messrs. Montague Burton, Ltd., and a contract has just been placed with the Lansdowne Building Co., Lansdowne-road, S.W. 9. The architect is Mr. H. Wilson, of Leeds.

Twickenham.—Messrs. F. W. Woo Co., Ltd., have acquired premises King-street, which are to be conve a branch stores. Plans have been by the company's architect.

Twickenham.—A site on the H House estate in King-street and W has been acquired for the erection o of three-story buildings, comprising and flats. Plans are being prep Messrs. D. Morris & Sons, 57, Chari S.W.1.

Uxbridge-road.—BUILDINGS.—The Donation Fund has decided to carry proposal to erect 246 self-contained t on about six acres of land near the road.

Woolwich.—ADDITIONS. — Mr. C. architect, Grecian-chambers, Devere Strand, W.C., has prepared plans tions to the Empire Cinema in (street.

Wandsworth.—FLATS.—The Housi mittee of the Wandsworth Borough have given instructions for tenders vited for erecting a block of 18 two flats on the Park Dairy site, Merton the Southfields Estate.

THE MONOMARK AND BUILDING INDUST

THE Monomark system, invented William Morris, was described in ou when it was first introduced to pub some time ago. The system h gained considerable support from a manufacturers, and merchants, a account of its special usefulness to t ing industry may now be given.

The system may be briefly expl follows:—British Monomarks Limi to manufacturers and merchants a dual and unduplicated Monomark, w sists of two or more characters w be the initials of the firm or the br of its products. These characters Monomark unless prefixed by BC means British Commercial Monom merchant or manufacturer is invited his goods with his monomark, eithe of his name and address or in co with it, preferably the former.

The system establishes between or seller of an article and a prospect a link of three or four letters whi tutes a method of communicati instance, an architect may become in a certain brick or tile. He ha turn it up and read the Monomark edge or the underside, make a n and on returning to his office, Monomark on a postcard and ask fo lars or for a representative to call. brick or tile been branded with mark, the architect could not co with the maker until he had disco owner of the trade-mark.

Fittings and building materials defaced by the name and addre maker or merchant. Under the system the identity of the manufa always be safeguarded by the imp the neat and inoffensive Monomark as it does for a full name and add

The Monomark Company has en an arrangement with the General whereby letters may be addres merely a monomark and the additi words "London, W.C.1." The stamped upon an article may be wr an envelope and posted as if fully and the letter will be delivered un the maker or the merchant of the question.

The Monomark Company claim have enough unduplicated Mono give one to every firm in the world, mark being composed of more characters. No British Commerc mark is issued to a foreign concern information on the system may b on application to Monomark Hou High Holborn, W.C.1.

WHITE LEAD.*

E have advanced far since the industrial lution first began. We now look upon workers as something more than a horde utomata from whom the last ounce of gy must be extracted, and we have found the healthy and contented worker gives is best more freely than does he who wn-trodden. We therefore protect him the dangers of machinery and power- n edged tools; make his place of work ventilated and sanitary, and do all we to preserve life within the industrial re. Such things are the obvious duty of anity, and, in principle, beyond the reach ntention. Where contention appears in ers of detail we do well to be guarded dgment and cautious in action, for it sy to grasp a few facts of a case and pret them as pointing in a single common tion, regardless of what we are doing here.

he case for making illegal the use of e lead in painting work can be made out conclusively as far as the man in the t is concerned. A certain sequence of of which most of us are aware would to leave no room for argument if taken heir face value. Lead poisoning is a l disease, slow and insidious : white lead int can transmit it to the worker both nanufacture and in use : painters as a have been shown to be particularly e to infection : substitutes have been d to be efficient, though containing no e lead in their composition. What argu- can there be against legislation forbid- the use of this dangerous poison?

st of us, however, are familiar with the ments against such a drastic step. In irst place it is no small matter to wipe ompletely an entire industry, or at least sorganise it completely while it is re- ructed for another purpose—the manu- re of efficient substitutes. Such a thing t lightly be undertaken. Again, many d craftsmen regard white lead as essen- o the composition of a lasting paint for n purposes. Good workers there are who their heads sadly over the material in t they have no faith, and good master- protest that they can only guarantee for which they are allowed a free of material.

y well (we say), at least let us have itions under which the use of this ial, which you say is essential, may be as little dangerous as possible. Let us rules of cleanliness, respirators, and wet ng down. Here again the obvious is not hole case. Cleanliness is one of the and most important safeguards; but we perfectly well that—to modify an old rb—you can take a man to water but an't make him wash. Pains and penal- or the non-observance of rules of cleanli- may work very well in the factory, or big job under careful supervision, but an on the little country job, or on the town jobbing work, is too often out of and out of mind, and men hate to be sy in their daily work. Then there is spirator. Here again it is easy to make le but difficult to enforce it. A respi- is an abominably uncomfortable thing ar as many war veterans know too well. he slow feeble attacks of lead poisoning t the insistent warning of mustard gas. ally there is the much-vexed question et or dry rubbing down. We have the problem of excessive consumption nd-paper by the introduction of water- papers, but we have yet to find a way olving the process that will equal the of the older and more dangerous d. Time is money, and high costs a check to the building industry. Does lot of property fall into decay through eluctance to spend on that necessary f paint, and are we not in danger of creating yet another housing problem if we make painting still dearer? And so we fly off at a tangent, to find that we really know very little indeed about the subject. We want more facts, and, with those we know, we want them marshalled before us so that the jury can announce their verdict and see that the sentence is carried out.

"White Lead," a publication of data collected by the International Labour Office, is actually an attempt to do for us this service. It comes very near to achieving its purpose. Beginning with an historical sketch of the movement against the use of white lead in paint, and passing through medical, statistical, and technical data to certain suggested legislative remedies, all dealt with exhaustively, it places its mass of facts in logical sequence and admirable detail.

One may perhaps be excused for regarding this work as the case for the prosecution, and for awaiting an equally studied defence, before committing ourselves to judgment. When this is done, humanity will doubtless be served.

It is stated in the preface that at the beginning of 1927 the White Lead Convention had been ratified by 13 countries : Austria, Belgium, Bulgaria, Chile, Czecho-Slovakia, Estonia, France, Greece, Latvia, Poland, Rumania, Spain, and Sweden. Ratification has been authorised in three countries—Hungary, Italy, and the Netherlands—and recommended in five—Argentina, Cuba, Denmark, Germany, and Uruguay. "In such circumstances an impartial survey of the facts cannot but be useful to countries which have already ratified, or are inclined to ratify, the Convention, while in other countries it may assist towards the creation of an informed and definite body of opinion."

THE LANDLORD AND TENANT (No. 2) BILL

THE Landlord and Tenant (No. 2) Bill passed the third reading on the 18th ult., great expedition having been shown in its last stages in the House of Commons. We are at the moment reviewing its provisions in these columns as considerable changes were effected in Committee. Since those articles were written some alterations have been made at the Report Stage, but these are not extensive, and we shall be able very briefly to indicate them after our next article has appeared so that a general idea may be gathered of the Bill as it stands.

It is rather significant in connection with legislation of this character that the first speaker on the Opposition side at the third reading debate should have characterised the Bill as "a very thin end of a sound wedge and they hoped that in the future this thin end having been inserted would be driven a good deal farther in," for restricting owners in the free use of their own property has proved before in connection with the Rent Restriction Acts a very dangerous experiment, which started from small beginnings but was "driven in" by Parliament until the wood into which it was driven commenced to split.

We agree with the observations made by certain speakers that the creation of special tribunals is to be deprecated, though Sir Henry Slessor may have overstated the case as regards the particular provisions of this Bill.

There appears considerable force in the observations addressed to the House by Sir P Pilditch, that if the Bill were very largely used—that is, if it were operated in detail—and it became the custom to appeal to the tribunal on every occasion, the uncertainty about property which would arise would do away with the benefits of the Bill, but the decent landlord and tenant would be well advised not to resort to the machinery of the Bill but to use its terms as a basis for agreement. Complaint was made that the Bill contained no definition of "goodwill," but that is a term which is well understood, and negotiations are taking place every day between assignors and assignees of leases as to the value of the goodwill attaching to the premises. The Solicitor-General is reported as having said that he saw no great distinction in principle between goodwill by which a tenant added to the value of his building and the addition to the value of the building which had been made by a physical structure. We can understand that that might be said if the Bill, as we understood was to be the case when the proposed legislation was first outlined by the Attorney-General, had been limited to renewals of tenancies, but the Bill goes farther than this and states that a tenant "on quitting his holding" may claim compensation for goodwill if he proves that goodwill has attached to the premises. Now, what can be more shadowy than this, and how can it be compared with structural improvements? Goodwill attaches mainly to the person of the man carrying on business in the premises; and when he leaves he may take the goodwill with him and again set up and develop another business of the same kind in the neighbourhood, for there is no restrictive covenant as to trading within a particular area in this case. Some goodwill may attach to the premises for a time, but that will depend upon the way the premises may be used by a new tenant, and it in fact attaches more to the locality than to the premises. Thus, to take an example, there are large well-known stores in the West End which have been built up entirely by the enterprise shown by the firm who has created the business. Suppose the lease of these vast premises to have come to an end and that it is not to be renewed; not less than 12 months before the termination of the tenancy the claim for compensation for goodwill has to be made, and how is the value of the goodwill attaching to the premises to be determined? At that time the lessor may not know who the succeeding tenant will be or the use he will make of the premises. The lessee may not have determined or been able to determine where he can carry on his business or whether he will continue in business, and the actual value of the goodwill may not be, in fact, ascertainable for years. In such circumstances the tribunal has to consider "the intentions of the tenant as to carrying on the trade or business elsewhere." Intentions are proverbially slippery and may be changed and may land the tenant close to his old premises, when any goodwill would subsequently disappear. A much-needed amendment was made in the Bill on Report which covers the point we raised above as to goodwill attaching to locality, as Clause 4 (1) (*d*) now provides that the tribunal "shall disregard any value which is attributable exclusively to the situation of the premises."

We fail to see how the observation quoted above of the Solicitor-General can be justified unless the Bill be limited to compensation for goodwill on renewal of a tenancy. In such cases the value can be calculated nearly as accurately as physical alterations in the structure, but where the occupying tenant is leaving, the goodwill savours of the nature of the will-o'-the-wisp, and even a tribunal may fail to catch it.

Coat-of-Arms for Fulham.

It is announced officially that Fulham is to have a coat-of-arms. The coat-of-arms will include representations of an ancient ship in token of Fulham having the longest river frontage of any borough in London, and a mitre to represent the association of Fulham with the Bishop of London.

Kronborg Castle Restored.

Kronborg Castle, the legendary home of Hamlet, at Oeresund on the Sound, has been completely restored. Till a year ago the castle was used as military barracks, but now it has been brought back to its original form, and the Danish authorities propose to turn it into a museum, every detail of which shall give a picture of the time of its builder, King Fredrik II.

THE INSTITUTE OF BUILDERS

HALF-YEARLY MEETING.

Technical education for the building industry was discussed in the speeches which followed a luncheon at the Grand Hotel, Birmingham, on November 24, in connection with the half-yearly meeting of the Institute of Builders.

The President (Mr. S. Guy Sapcote, F.I.O.B.), who was in the chair, was supported among others by the Lord Mayor of Birmingham, Dr. P. D. Innes, M.A., D.Sc. (Director of Education, Birmingham), Councillor R. H. Hume, M.A. (Chairman of the Birmingham Evening Classes and Technical School Sub-Committee), Dr. R. E. Stradling, M.C., D.Sc., A.M.Inst.C.E. (Director of the Building Research Station, Garston), Dr. W. E. Sumpner, D.Sc. (Principal, Birmingham Central Technical College), Mr. Martin, S. Briggs, H.M.I., F.R.I.B.A., Mr. E. C. Bewlay, F.R.I.B.A. (President, Birmingham Architectural Association), Mr. Percy W. Cox (President, Birmingham Association of Building Trades Employers), Mr. R. A. Costain, F.I.O.B. (Vice-President), (Liverpool), Mr. J. Croad, F.I.O.B. (Gosport), Mr. J. H. B. Dixon, F.I.O.B. (Birmingham), Mr. W. W. Dove, F.I.O.B. (London), Alderman Alfred Dowling, J.P., F.I.O.B. (Bristol), Mr. G. Elvins, F.I.O.B. (Birmingham), Mr. G. A. Hewitt, F.I.O.B. (Leicester), Mr. F. G. Hodges, F.I.O.B. (Chairman, Midland Branch of the Institute) (Burton-on-Trent), Major Ralph J. Holliday, M.C., F.I.O.B. (Past-President) (London), Mr. W. Ivens, F.I.O.B. (Coventry), Mr. W. H. Jones, F.I.O.B. (Coventry), Mr. W. Kendrick, F.I.O.B. (Walsall), Mr. W. Moffat, F.I.O.B. (Birmingham), Mr. G. Anstee Perks, F.I.O.B. (Nottingham), Mr. John B. Whitehouse, F.I.O.B. (Birmingham).

The Chairman, in proposing the toast of "Our Guests," said that the Institute had identified itself with technical education practically ever since its foundation. This education for the building industry resolved itself broadly into two parts—education for the craftsman and education for the future administrative and master types. The more immediate concern of the Institute was with the latter type which, it was felt, had suffered neglect. Building was a team job. The Institute recognised the valuable educational work done by the Royal Institute of British Architects and by architectural classes, but they felt that in the interests of building the time had arrived for builders to take their rightful place and to shoulder their proper responsibilities in the matter of building education. He welcomed, too, Dr. Stradling. Building science was in its infancy. Very largely building to-day was still the result of the experience of trial and error methods of past generations. Modern conditions did not permit the risk and expense of full-scale experimentation. Such work had to be done in the laboratory, and it was essential that they as an Institute should see that full use was made of the result of Dr. Stradling's investigations. They wanted the master builder of the future to be scientifically trained and fully equipped with up-to-date knowledge of materials and construction as well as in those other important subjects to the builder, such as costing.

The Lord Mayor briefly responded.

The luncheon was followed by a lecture delivered by Dr. R. E. Stradling (Director of the Building Research Station of the Department of Scientific and Industrial Research). Mr. F. G. Hodges, F.I.O.B. (Chairman of the Midland Branch of the Institute), who took the chair, said, in introducing the lecturer, that it was of the greatest interest to the Institute that the work of the Building Research Station should permeate the industry. It would be to their interest to do their utmost to develop contact between the Institute and the Research Station.

Dr. R. E. Stradling, whose lecture was illustrated with slides, said the question was often asked, What was the use of building research or building science? If the best methods had not been developed over the thousands of years during which building had been practised, was it likely that by scientific work improvements could be made? Such queries arose from a lack of appreciation of the way in which the industry had developed its methods. In normal building work nearly the whole of the processes were traditional, handed down from father to son. This traditional knowledge was really a result of experimentation on the full scale. By trial and error over many years certain methods and materials were found to produce the result required in the particular construction and in the particular situation where the construction was to be erected. But the results of experimentation of this kind were only applicable when the conditions which were in operation when the trials were made were exactly reproduced. If any variation took place in those conditions, then the traditional result would not, in all probability, be reached.

The conditions of ancient construction could be considered under two headings: (1) the requirements demanded of the finished structure, and (2) the materials available for building. Builders at the present day would admit that both these sets of conditions had been changed in modern civilisation. The demands upon a finished structure were different from those made years ago; the materials available were widely different. Was it possible by laboratory experiments to elucidate the difficulties which had undoubtedly arisen in modern building due to the non-applicability of traditional methods in building to-day? He wanted to show by one or two examples that such assistance could be given by the application of scientific methods to the study of construction and materials.

WATER.—In considering the action of water on building materials it was convenient to divide the effects into two classes: (*a*) those which were due to water *as such* and (*b*) those which were due to water as a solvent bringing solutions into contact with building materials. Water could be present in building material in any of three ways: (1) in chemical combination, (2) as free water, (3) as sorbed water.

CHEMICAL COMBINATION.—Water was said to be chemically combined when it was so associated with some other substance as to form a different material from either of the two constituents. For example, if water was added to quicklime then slaked lime was formed. This slaked lime was a definite combination of water and quicklime—hydrated lime. An example of this in practice was given by a case of the spalling of a ridge tile on exposure to the weather. Moisture penetrated to a fragment of quicklime left in the tile after coming from the kiln. This caused the lime to slake and expand, forcing off the fragment. Here was an example of direct disintegration due to water combining with a certain constituent of a material.

Rain passing through the atmosphere of our towns dissolved those sulphur compounds formed during the burning of coal. The solution formed was either sulphuric or sulphurous acid. When this reached limestone it attacked it, forming calcium sulphate. The calcium sulphate crystallised in the pores of the stone when the weather was dry. The growth of the crystals exerted force enough to disrupt the stone.

FREE WATER.—Water was termed "free" when associated with a solid in such a way that its properties remained unchanged. One of the chief objections to the presence of free water was its power as a solvent. An example might show how important the presence of water might be in causing decay. It was the case of a brick wall which had been repointed. Instead of the repointing decaying as had the original pointing, t brickwork itself decayed. This was a qu common experience amongst those who l to deal with the maintenance of old bui ings. The attempt to repoint with most durable pointing had in very ma cases resulted in the deterioration of stonework or brickwork.

The effect of freezing also requi examination from rather a different an than usual. At the Research Station effo had been made to measure the actual str which occurred when water froze in pores of the material.

SORBED WATER.—So far as build materials were concerned, "sorbed" w in association with the solid was in a dition intermediate between the chemic combined water and the free water refe to above. It was certainly held more fir to the solid portion than was free wate for instance, the boiling point was hig and the freezing point lower than those "free" water—but it was not held strongly as to form a definite chemical c pound. The point to realise was that amount of water thus associated depe upon the external humidity conditions.

The state of matter in which a solid stance was associated with sorbed water usually termed "colloidal." The n "gel" used in this connection came f gelatine, which was itself a typical gel. was well known, gelatine swelled when pl in water and shrunk when dried. Ano example was catgut, used in so many form hygrometer—for example, the old-fashio weather gauge, consisting of two figure man and a woman.

As with the catgut of the old wea gauge, so with many building materials constant adjustment was taking place, te ing to bring about equilibrium between moisture content of the air and that of solid, and accompanying this change of m ture content of the solid there was a ch in size. The water associated in this with the solid matter was what was te "sorbed" water. Timber furnished example well known to every builder swelled when it absorbed water, sh when it dried, and was weaker when it wet than when dry. It was not al realised that similar properties were sessed by other materials. An examp great practical importance was provide cement and concrete; for correct hand an intimate knowledge of these moi movements was necessary. Crazing, sh age cracks, etc., and the consequent ru of reinforcement were generally due nally to those moisture changes.

CONCLUSIONS.—In the case of concrete had quite a good example of the attem apply traditional methods to a new mat The old form of concrete in use many ago was almost entirely mass work. the advent of reinforced concrete, the ing craftsmen had no traditional experi to fall back upon apart from that old of construction. In the heavy mass moisture movements were not of impor but with the material as now used in lighter sections and associated with those moisture movements became of s import.

Those subjects were all being studi the research station. How was the ini tion to become part of the working ledge of the building industry? It s to him that this could only be do very much greater emphasis on the sci side of the education of entrants int building industry. The Institute ha under consideration for some time the tion of the establishment of University and he wished to appeal for full-h support to this movement of their organisation. He trusted that the In would be successful in establishing a one Chair of Building Science, and th chair would be of the right type to model for future ones.

A vote of thanks to the lecturer, pr by the chairman, and seconded by R. J. Holliday, concluded the proceed

RATES OF WAGES IN THE BUILDING TRADE

For rates of wages in the Building Trade in Scotland see page 882.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, etc., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

The National Federation of Building Trades Employers: Change of Title.

We are officially informed that the Federation has adopted a revised constitution and title which will operate as from January 1, 1928. On and after that date the correct full title of the Federation will be "The National Federation of Building Trades Employers," the words "of Great Britain and Ireland" being omitted.

THE SCOTTISH BUILD

HOUSING PROGRESS IN SCOTLAND

The following figures show the progress that has been made in State-aided housing schemes in Scotland to October 31, 1927.

*These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployments Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

TRADE NEWS

Change of Address.

Messrs. Rhodes' Chains, Ltd., announce that on and after December 10 next their registered offices will be transferred to Faraday House, 8-10, Charing Cross-road, London, W.C. 2 (opposite the Alhambra), where they have secured commodious first-floor accommodation in the same building as their London Depot and Despatch Departments, a movement which will greatly increase facilities for giving prompt attention to customers' requirements.

Business Amalgamation.

We are informed that the Morris Westminster Guild has acquired the architectural metal work and bronze foundry business of Messrs. J. W. Singer & Sons, Ltd., of Frome. Resulting upon this acquisition the following amalgamation has been accomplished :—the architectural metal works and bronze foundries of J. W. Singer & Sons, Ltd., and the Morris Art Bronze Foundry, the metal window works of the Morris Westminster Guild, the stained and leaded glass works of William Morris & Co. (Westminster), Ltd. The operations of these firms will henceforth be conducted under the name of the Morris-Singer Co., of London and Frome. Mr. William Morris will remain chairman and managing director of the company. Although inquiries addressed to the respective firms in Frome or London will receive attention, it is requested that all correspondence be directed to the Morris-Singer Co., Head Office, Morris House, Rochester-row, Westminster, London, S.W.1. Telephone: Victoria 6443 (3 lines).

British Industries Fair, Birmingham.

Extensive additions are being made—so we learn—to the permanent buildings of the Heavy Section of the British Industries Fair in Birmingham. A third span is being added, which will give a total enlargement of floor area for the year of 115,000 sq. ft. The Fair is from February 20 to March 2, 1928

The G.E.C. Bound Catalogue, 1927-28.

We have received a copy of the bound catalogue issued by the General Electric Co., Ltd., of Magnet House, Kingsway, W.C.2. The first electrical catalogue issued by the G.E.C., in 1888, when electricity was in its earliest stage of development, was regarded as a remarkable achievement. It was unique in that it embraced every electrical device which was at that date on the market. The present issue of this catalogue is unlike its predecessors in one respect, as, although it runs to nearly a thousand pages, it does not list in detail every item of the various ranges of G.E.C. products. At the same time, although it does not contain every item of the Company's manufacture, it *does* include representative examples of practically all the leading lines of G.E.C. electrical apparatus. There are examples of equipment for the largest generating stations and power-transmission systems, railway electrification, telephone exchanges and the like on one hand; and, on the other, Osram lamps, Magnet appliances, fittings, and the smallest electrical accessories.

The usefulness of such a catalogue to the contractor and the dealer cannot be over-emphasised. Instead of a number of separate catalogue sections through which to search—and loose catalogues have a vexing habit of straying—there is provided a single volume which, on account of its size, could not well be lost sight of, even apart from its everyday value. It is, indeed, a medium which will serve constantly as a reference in quoting for every type of electrical accessory now manufactured, each item or appliance listed being briefly described and the price given in clear type. There is, in addition, an extensive glossary of technical terms, wiring tables and conversion tables, each of which can be taken as authoritative and dependable, and likely to be of service frequently. Three separate forms of wiring specification are also included, and these should be of very real assistance to the contractor called upon to draw up such a document at any time. Useful information supplementary to that appearing in the ordinary trade catalogue has always been a feature of G.E.C. bound catalogues, and this volume is in no way behind its predecessors in this respect.

Valves and Fittings.

We acknowledge receipt of the October number of "Walworth Log," issued by the Walworth Company of New York, makers of valves, malleable fittings, die stocks, etc. There is some account of the American oil industry. From it we take the following paragraph :—"From a beginning as recent as 1859 the American oil industry has risen to a position second only to agriculture and transportation. Estimates of the capital invested in the oil business run as high as $11,000,000,000. The American Petroleum Institute placed the total world production of petroleum at 1,096,608,000 barrels. Of this amount the United States produced 775,000,000 barrels, or 70.7 per cent. of the total. Mexico was second with 8.2 per cent., Russia third with 5.5 per cent., and Venezuela fourth with 3.4 per cent. Since considerable crude oil from Mexico and South American countries is imported, it is safe to say that more than three-quarters of the world's oil industry is centred in the United States." The "Log" will gladly be sent upon application to 90-96, Union-street, S.E.1.

Tilting-Type Concrete Mixer.

We have received details from the makers, Messrs. Marshall, Sons & Co., Ltd., Gainsborough, of the new Marshall-Benson concrete mixer. These designers have had more than 15 years' experience with various types of tilting-type mixers with the result that many weak points have been eliminated while several new features have been introduced. The mixing action of the machine is, we believe, very good, there being no possibility of separation of aggregate or of clogging of the bottom of the mixing bowl. The arrangement of the paddles ensures a thorough mix, a quick discharge, and a clean interior of the mixing bowl. The machine is extremely portable. The four wheels may be changed for direction in a few minutes, by the removal of certain pins, to convert the machine from end to side discharge. There is no jacking up, no removal of wheels, we learn. Speed and cleanliness of loading, mixing, and discharging are other factors responsible for economical running. Details may be obtained from the manufacturers.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXIII. No. 4427 DECEMBER 9, 1927.

FIRE PREVENTION AND ESCAPE

THE public appears to show less sense of responsibility to the ruthless danger and destruction caused by fire than it does towards rail accidents or even to the perils of the road. At the best it accepts and installs "escapes" in buildings of importance; if s so in private erections, it tends to overlook them or fails aintain them in order; there is lacking any sustained nsibility or even fear towards this unrelenting enemy to ome—an enemy that as likely as not comes suddenly and ly in the night. The recent tragedy in Kent, where a er and father lost their lives in the ineffectual attempt to heir child of four and an elderly nurse proves that, even very well-to-do household, the most beloved and helpless per may be located in what must have been a compara- inaccessible room. Young children should occupy a -proof situation. It is one of the horrors of fire that the gle for escape takes place in the dark, handicapped by e suffocation and intense terror. The only safeguard in se of ordinary construction is a familiar alternative exit. blic propaganda would appear to fall under two heads: protective; and secondly, remedial. The advice of all ects should be enlisted towards the first, in the hope n the future buildings and dwellings should be constructed fireproof a fashion as possible. Many clients and their will accept an estimate that is initially heavy if it includes ar labour-saving "devices," some of these being more ious than practical, and it is difficult to believe that ous persuasion would not induce the same individuals ree to a scheme which would obviate the possibility of wreck and destruction. Without pushing precautions treme limits, it is practicable to construct an ordinary ing with concrete floors and stairs, and light ironwork ters, even without going to the ideal expedient of replacing en rafters by concrete or steel joists. The danger zones private house are the basements, cupboards, and attics—ill-lighted and therefore more dangerously exposed to the ssness of a casual visitor, armed with an odd candle that be stuck to the floor by the medium of its melted grease. much-abused fused wire of the electric light represents the itous "snake-bite" of mysterious death in India, and is bly far less responsible than is usually believed. Every m new or old requires overhauling and attention, but with equate fuse box there should be little danger with a modern m, always provided that the flex wire fittings to portable s are switched off at the wall and are not left with a per- ntly live wire operated at the lamp. Such coverings fray and the wires are unfit to carry the current when not observation.

is clearly impossible to avert minor accidents—the tten cigarette end, the sportive spark from an open fire, that enemy to society, the person who reads by candle- in bed—but it is definitely feasible to limit the range of ter and loss. Fire-resisting solutions for hangings, wood- and draperies are on the market, and many have given ishing proof of their qualities immediately after appli- n, but it would be a help to architects if some precise and impartial information could be circulated indicating the effects of certain chemicals and their lasting properties. There does not appear to be any pamphlet or short cut to the subject to which an architect can refer a client. Many makers of water paints stress the fire-resisting qualities of their products and there appears to be little doubt that woodwork when first covered with such preparations is less liable to flare up; if this virtue persists with time then a very great advantage in semi-resisting or non-flaring woodwork has been secured. Much valuable information might well be made public on the practical treatment of soft wood floors. Certain varnish stains would appear to be directly inflammable, especially when applied to thin soft wood panelling, and the danger increases with age. Firms retailing products which they can conscientiously claim as reducing fire risks should advertise this virtue more widely and, no doubt, they would do so were that virtue as much appreciated as it should be. We might suggest that a special fire-resisting paint and fabric section could be usefully staged for the help of both architect and public at the next Building Exhibition. Such a section should include the non-flaring as well as the completely fireproof.

It may be argued that such partial expedients are but palliatives while the unexposed wooden joists, the floor boards, and the dry seasoned rafter remain, like a laid fire, awaiting their opportunity in the normal home. It is, however, just these details of curtain and furniture which in abnormal circumstances start the trouble, and therefore a general propaganda drawing attention to the danger is likely to help the demand for structurally fireproof buildings.

It is surprising that the great insurance companies are not more active in this matter. If, together with his annual premium notice, the average householder were to receive a single sheet of notes and warnings, a timely reminder would be achieved at the most opportune moment. Such notes might include a list of common dangers, timely precautions, and principles for safety and escape. The general ignorance is abysmal, and it would astonish anyone of elementary scientific knowledge to realise how few ordinary men and women—let alone children—would think of using a wet cloth over their mouths to overcome the effects of smoke. If this one precaution were emphasised at "premium time," many valuable lives would be saved. Instead of such a hint, the timorous householder is more likely to unfold a large coloured picture of a "conflagration," with the legend underneath to the effect "Safety is impossible. Insure with us." There should be useful scope for co-operation between architects and insurance companies when policies are made out. The flat rate principle is not adopted in making out a life policy for an individual; the medical profession is invoked naturally and normally as referee. How many architects have been consulted by insurance companies in framing a new policy or in overlooking a property covered by an old one? The companies may fear that investigation would frighten their clients and that competition is so great that the rival who claimed to leave his patrons alone would prosper. It is, however, unlikely that any reasonable client would resent impartial inspection and sensible advice from an agreed architect; it is, after all, as much to his advantage not to have his house burnt as it is to the company. Briefly, a fire helps nobody and the sooner everyone joins to minimise the risks the better for the whole community.

NOTES

Professor Lethaby.

THE profession generally must have felt that the care of Westminster Abbey was in safe hands when Professor Lethaby was appointed to its guardianship, and it will, we are sure, be much regretted that he feels unable to continue his task after next year. The long period of literary service to the profession, and which is still continuing in the columns of *The Builder*, by Professor Lethaby, will, we hope, continue for a long time.

The New R.A.

THE charming little figure on the Bond Street Picture Gallery which Mr. Henry Poole did for the architects, Messrs. Lanchester and Rickards, has been for many probably the most conspicuous example of the sculptor's work. But he has done so much and so well that it will be generally agreed he merits the full membership of the Royal Academy just now given to him. His inclination has been towards grace and refinement, which may have militated somewhat against the more architectonic qualities, but he has had several excellent opportunities to display his gifts, and one of the most successful was the King Edward Memorial, in connection with Messrs. Lanchester and Rickards, in front of the Victoria Rooms at Bristol.

R.I.B.A. New Premises.

A REPORT has appeared in a daily newspaper to the effect that the R.I.B.A. are proposing to move the headquarters of the Institute from Conduit Street to an address in Burlington Gardens. The question of removal to more adequate quarters has been before a committee of the Institute for some years now, but we understand, upon the authority of the Institute, that the report in question was entirely unauthorised, and in fact erroneous, since the committee has arrived at no conclusion whatsoever.

The League of Nations Competition.

IN our notes last week on the League of Nations designs at the Institute, an unfortunate mistake occurred in reference to the design of Mr. James Burford. The design referred to as his was, obviously enough to those who went to the exhibition, a description of another design. Mr. Burford's plan was a very able one, laid out in rectangular lines, and was certainly one of the best shown. The *salle d'assemblée* occupied one end of the site and at the other end was a large *cour d'honneur*, with the secretariat flanking one side and the *conseil* the other. The intercommunication between the various parts of the building was admirable, and the plan had a simplicity and direction which was only too lacking in many. We much regret the mistake occurred, but we should like our readers to know that our criticism did not apply to Mr. Burford.

The Elgin Marbles.

A SUGGESTION which Professor Lethaby makes in his concluding article on "Parthenon Studies," which we give this week, deserves the careful consideration of the British Museum authorities. "The marbles," he says, "are housed in a fine room, but they should be even better shown than they are. Changes have come about by degrees, but the large question of general rearrangement should be faced. Everything is placed far too high; it was a Victorian superstition that you should have pictures, but hang them near the ceiling. If the marble platform on which the great figures are set were reduced to half its height, they would still be lifted as high as the Ægina sc tures at Munich. The frieze is equally high, but probably that must now accepted, except that little platfo might be placed here and there so t one may get up to it. A way of brin the metopes down where they can examined must be found."

Sanitary Accommodation for Lock-up Shops.

FROM time to time diffic arises in connection lock-up shops, owing to absence of water supply sanitary accommodat With a view to avoiding such difficu and preventing inconvenience and to the owners and occupiers, it is desir that builders, shop-fitters and other tractors consulted with respect to construction of lock-up shops sh direct the attention of their clients to necessity for the provision of water sup and sanitary accommodation in con tion therewith. Everyone concer knows that if any alteration of sanitary accommodation or drainag required, plans must be submitted to local authority, but it would be advantage if owners or occupiers posing to establish lock-up shops to submit their proposals respecting sanitary accommodation and wa supply to the local sanitary autho before deciding on their construct whether they be in connection with buildings or with the adaptation alteration of existing buildings. We that Mr. C. W. Hutt, Medical Office Health to the Borough of Holborn, addressed a letter to this effect to buil working in the area under his supervis

Rural England.

THE Council for the Pre vation of Rural England just completed the first of its existence. The sident, Lord Crawf pointed out at its first Annual Ger Meeting this week that the C.P.R had not only justified its existence, had been recognised already as a ne sity. The numerous problems on w the Council has been consulted and variety of issues raised give proof or great possibilities for future activi It is noteworthy that among the affili societies are groups in Australia, mania and Canada. It is still s significant that at least one grou American architects give their sup to the Council. It is but one of many indications of the value w overseas people set upon the un beauty and interest of the En countryside. It must be particu gratifying to those responsible fo activities that the Council can repor much visible evidence of its value a advisory, co-ordinating and educ body. For example, the prompt i vention of the Council prevented carrying out of the proposal to fo motor park close to the Abbot's Kit at Glastonbury; the Thames V Preservation scheme is due to actio the part of the C.P.R.E., while it has passed on to the appropriate constit bodies such problems as fell within

By kind permission of "Flight."

The Schneider Trophy.

and has been a means of effect-
ultation on points relating to
hands of the specialist bodies
en strengthened in their own
the support of the rest. There
ubt that, largely owing to the
efforts of the Council during the
r, there has been a marked in-
public consciousness of the
he countryside, and of the dead
ch its spoliation spells. Yet
nsufficiently realised how urgent
ed for action and control in the
of destruction, disfigurement,
evelopment, and disregard for
ion of landscape and building.

SIR LESLIE SCOTT, K.C., M.P., in a valuable and lucid address on the legislative side of the Preservation of Rural England, referred to onceptions liable to arise when nt title "Town Planning" was the control of rural areas. He hat "Town and Country Plan- uld be a phrase more suitable ation to the powers of control lopment in a wide area. Another ad previously suggested "Rural " as a suitable expression, and evident agreement that much slation safeguarding the country- inoperative or unacceptable ing to its being made from a own point of view. This fact, and that of ambiguous nomenclature, undoubtedly deters many individuals and bodies anxious to promote the preservation of the country from throwing their weight on the side of the utilisation of such powers as are actually possessed by local authorities for the purpose. The Council for the Preservation of Rural England is giving much attention to the study of causes and remedies where the spoliation of the countryside is concerned, and among the remedies may be counted the restoration of old cottages under the Housing (Rural Workers) Act, on which subject the Council's expert advisers have prepared a pamphlet. Not the least important step, in this as in other aspects of preservation, is the education of the public, one of the primary aims of the Council. It is necessary that the fact expressed by Sir Theodore Chambers should be more universally recognised: "Man has it in his power to save beauty and to create beauty."

The Wheelwrights' Shop.

WE are glad to read of the publication of "A small boy of the Sixties," by George Sturt, or, as he was known as a writer in his lifetime, by "George Bourne." No less delightful as an author than as an interpreter of rural craftsmanship and the owner of a wheelwrights' shop, recorded in his book called "The Wheelwrights' Shop," reviewed at the time in these columns, George Sturt described with intimacy and much simplicity the methods of work as carried on from father to son in the little village of Farnham. Tracing the influences accumulating during the period of accentuated change from the sixties onwards, he describes the gradual disappearance of the old traditional methods under the development of machine production. His vivid record strengthened by the closeness of his own contact with what he describes as the inheritor of a wheelwright's shop himself, presents us with a picture of a now almost past life, lived under conditions of much happiness and pride in work, though finding little time for leisure and but poorly paid.

Wall Painting.

PROF. A. P. LAURIE makes some useful suggestions in a letter to the *Times* for the treatment of wall paintings, and the materials he suggests, so far as materials themselves are concerned, may be accepted as reliable. It is, however, the case that the method of handling the materials as well as the materials themselves enters into the question of their permanency, and though their painting may be desirable, it should not be too thin. There is a wide field for the application of wall painting, as suggested, in waiting rooms of stations alone, though whether it is likely that railway companies will be ready to meet the extra cost at the present time may be doubted. The decorations in the Refreshment Room at the Tate Gallery suggest a method of employment, in the plan adopted under which the artist was paid a weekly wage over the period of execution. The direction to-day is towards lightness, and to create a cheerful character in our surroundings, and the decoration of wall surfaces in our private and public buildings is a very suitable way of doing it. The present outlook would seem rather to exclude the more monumental forms of wall painting, such as we associate with the great traditions of the art and are directed towards a pleasant and more popular interpretation. We are in no epic mood to-day, rather distrusting ideas, and perhaps have no epic to inspire us! Meanwhile we should be glad to see this more popular direction encouraged, though not forgetting that the tendency to-day towards more ephemeral treatment, still leaves unattained its highest expression as an interpreter of the soul of a nation.

The Schneider Trophy.

THE exhibition of the seaplane in which Flight-Lieut. Webster, A.F.C., R.A.F., won the recent race for the Schneider Cup at the great speed of 281 miles an hour, has drawn large crowds to the Horse Guards Parade. As compared with some of the huge commercial aeroplanes, this machine is comparatively tiny, but there is something inspiring in the severity of its lines and in the simple rationalism of a design created for sheer speed. On view also is the "Schneider Cup," which we illustrate on page 888, and which is remarkable in that it is not a "cup." but a fine piece of sculpture. The exhibit as an entity illustrates yet again how Progress and Art go forward hand in hand.

Carved Pine Cross for a Memorial Hanging Rood, Christ Church, Streatham Hill, S.W.

Designed and Painted by MR. A. E. HENDERSON F.S.A., R.B.A., L.R.I.B.A.

GENERAL NEWS

Professional Announcements.

We learn that the position of County Surveyor for Co. Offaly is vacant through the death of Mr. Ignatius O'Sullivan, C.E., who held the office since 1909.

Mr. W. E. Norman Webster, F.R.I.B.A., chartered architect and surveyor, of 1a, Newroad, Spalding, Lincs, has taken into partnership Mr. Thomas F. Trower, L.R.I.B.A., chartered architect and surveyor. The practice will still be carried on at the same address under the name of W. E. Norman Webster, F.R.I.B.A., and Thomas F. Trower, L.R.I.B.A., chartered architects and surveyors.

Honour for Sir Robert Lorimer.

The King has created Sir Robert Stodart Lorimer, A.R.A., F.R.I.B.A., a Knight Commander of the British Empire.

An Antiquary's Estate.

Mr. James Donald Milner, F.S.A., Sidcup, Kent, Director, Keeper and Secretary of the National Portrait Gallery since 1916, left £2,448.

Rugby Football Match.

The second annual match between the Surveyors' Institution and the Auctioneers' and Estate Agents' Institute was won by the Institution, the score being three goals and five tries (30 points) to two tries (six points).

Whitgift Foundation Scheme.

The Governors of the Whitgift Foundation have appointed Messrs. Leathart and Granger architects for the Haling Park, South Croydon, proposed £150,000 school.

Resignation of Professor Lethaby from Westminster Abbey.

The Dean and Chapter of Westminster announce with regret that Professor W. R. Lethaby has felt obliged, owing to increasing years, to tender his resignation as Surveyor of the Fabric to the Abbey (see Note on p. 888). The resignation will take effect next year.

Ulster's New Parliament Buildings.

The Prime Minister of Northern Ireland (Viscount Craigavon), members of the Government and of both Houses inspected on Wednesday last the progress made in the construction of Ulster's New Parliament Buildings, at Stormont, Belfast. The visitors were received and afterwards conducted over the building by Mr. Wm. J. Stewart, principal of Messrs. J. and W. Stewart, contractors, and by Mr. Thornely, F.R.I.B.A., architect.

Architectural Students' Theatricals.

A play, "The Sport of Kings," by Ian Hay, is to be produced by the students of London University School of Architecture on Monday and Tuesday, December 12 and 13, in the University College Gymnasium, at 8 p.m. The proceeds of the play will go to University College Centenary Appeal Fund, one of the objects of which is the endowment of the School of Architecture. Tickets, 3s. 6d., 2s. 4d., and 1s. 2d., may be had on application to Miss Hall, Bartlett School of Architecture, University College, Gower-street, W.C.1.

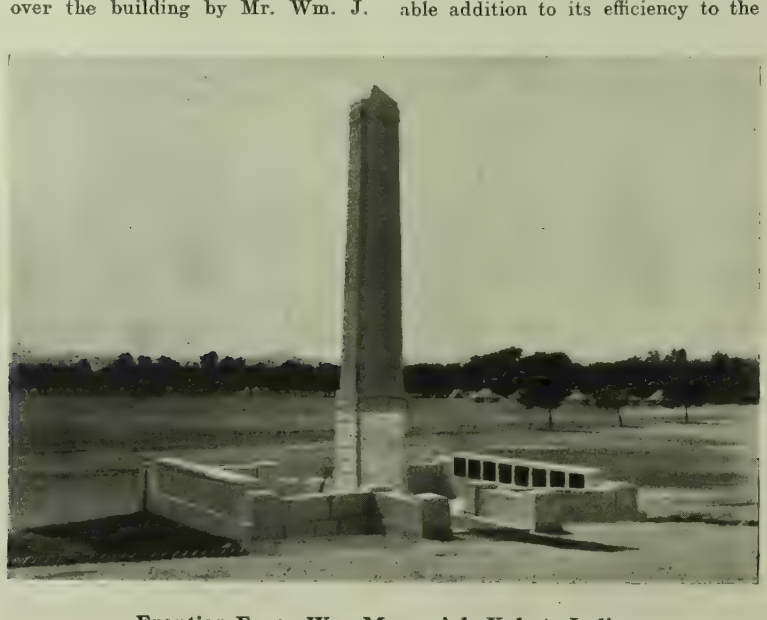
Discovery in Ancient Welsh Church.

An interesting discovery has been made at Dynevor Castle, Carmarthenshire, the residence of Lord Dynevor. When a thick growth of ivy on the south wall of the old family church of Llandyfeisant in Dynevor Park was being removed, a pointed arched doorway was revealed, leading to a cell-like apartment, built, it is stated, on the site of a Roman temple.

New Royal Academician.

At a general assembly of Academicians and Associates held on Monday, Mr. Henry Poole, A.R.A., sculptor, was elected a Royal Academician. Mr. Poole, who is 53, was elected A.R.A. seven years ago. From King's College School he went to the Lambeth School of Art and then to the Academy Schools, and studied under the late Mr. Harry Bates, A.R.A., and Mr. G. F. Watts, R.A. Mr. Poole's accomplished work is seen in sculpture on the naval memorials at Portsmouth, Plymouth, and Chatham, and on various public buildings, including the Central Hall at Westminster (see Note on p. 888).

New Institute of Pathology.



The Bernhard Baron Institute of Pathology, which Sir Humphry Rolleston opened on Tuesday at the London Hospital, Whitechapel, benefits a department which has long been inadequately housed. Hitherto the pathologists attached to the hospital have carried on their work in a few small rooms, but the new institute provides them with 12 large laboratories and three smaller ones, a lecture and class room, three rooms for dealings with animals, a post-mortem theatre, and a mortuary chapel. There is also accommodation for the invaluable collection of case-records and microscopic slides which Professor Turnbull has made the basis of the research work done in his department. The hospital owes this considerable addition to its efficiency to the generosity of Mr. Baron. Mr. J. G. ... L.R.I.B.A., A.M.I.Struct.E., was architect.

the direction of Messrs. Hicks & od, the Newcastle architects, the

Mural Painting, "Jacob and Esau," in Church at Wensley, Yorks.

work is being carried out by Messrs. R. T. Snaith & Son, Ltd., church and school fitters, of Darlington, who also have a wide experience in church restoration work. The contract for the absolutely essential portion of the work amounts to over £2,000—nearer £3,000 being required if full justice is to be done. It seems to me a pity that the preservation of such historic monuments as our ancient churches should not be a matter of wider concern than of those in the immediate neighbourhood. Judging by the numbers who visit the church, there must be many who would be willing to support so worthy an object. Donations are being earnestly solicited and will be gladly received by the rector—the Rev. V. C. FitzHugh—or the Hon. Nigel Orde-Powlett, Bolton Hall, Leyburn, Yorks. The rector is always delighted to conduct visitors over the church, which contains much more of thirteenth-fifteenth-century work in screens, brasses, etc., all of which are noted in the Hon. Nigel Orde-Powlett's short history of the church.

VIATOR.

A Defence of Quantity Surveyors.

SIR,—I have read "Northern Fellow's" letter in the last issue of *The Builder*, and think he has failed to realise the basic objection to quantities being prepared by, or in the office of, the architect who has prepared the drawings of the job in question. The duties of a quantity surveyor are frequently exercised in a quasi-arbitrational capacity—particularly in the final settlement of the contract.

It is therefore surely obvious that he should be in an unassailable position to deal with all matters in which there may be any difference of opinion, which would not be the case were he in the position referred to by your correspondent.

I hope you will extend the hospitality of your columns to any further correspondence you may receive on this point. F.S.I.

[Our columns are, of course, open to further correspondence on this subject.—ED.]

SIR,—I really do not think that quantity surveyors require to be defended. They are the inevitable outcome of specialisation. They will be required and will thrive most where industrial development is at its greatest and most efficient.

In reference to Northern Fellow's letter in your issue for December 2. For the last twenty years, at least, there has certainly been no attempt, at any rate in the south, to train architects in the preparation of bills of quantities. No qualified quantity surveyor could object to any properly qualified men preparing bills, but what recognised qualifications are there except those of the Quantity Surveyors' branch of the Surveyors' Institution, or to a lesser degree the Building Surveyors' Branch? There are not, I believe, many architects who possess these qualifications, nor have they time, in addition to their own work, to undergo the long term of training and practical experience that such qualifications aim at ensuring. Such a period of time is essential not only to master the technical detail but also to obtain that "balance" necessary properly to undertake the responsible duties of a quantity surveyor.

The principle of architects leaning on assistants, even qualified in the branches of the Surveyors' Institution referred to, is surely hopelessly wrong. Would an architect think a client properly served if a quantity surveyor engaged an architectural assistant to carry out architectural work?

Moreover, the preparation of bills of quantities is only part of a quantity surveyor's duties. If an assistant has reached the stage when he can prepare a complete bill, he is barred in the capacity of an "assistant" from carrying out the other important functions of a quantity surveyor, even if he is otherwise capable. From the execution of these other functions the architect is also barred, for he cannot be independent of himself.

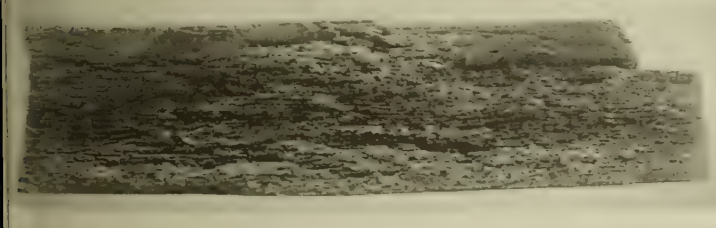
There is no one more appreciative than myself of the work of architects, and no one more happy in his relationship with them. My experience is that the architect realises that one of the chief assets of the quantity surveyor arises from his *independent position* not only in relation to the preparation and issue of bills of quantities, but also in the responsible duties placed upon him when named under the R.I.B.A. contract and in the many other unostentatious ways in which he can act to the advantage of client, architect and contractor alike.

A LONDON CHARTERED QUANTITY SURVEYOR.

An Appreciation.

SIR,—During the fifty years I have been reading *The Builder* I don't remember a better set of Gothic drawings than those shown in your issue for December 2. May the student become a second Pugin.

EDWARD VALE.



Weston-super-Mare.

Architectural Competitions.

SIR,—Is it quite impossible for competitors to get a "square deal" in architectural competitions? Whilst the correspondence columns of your paper are still full of complaints as to awards in the Herne Bay competition, the Guildford School result is out.

In this case price is the basis. The conditions stated that a design shall be excluded "if the assessor shall determine that its probable cost will exceed by 10 per cent. the estimate of the competitor." The winners, cubing the school "at about 10d." (see assessor's report) arrive at a total of £11,060. The assessor's estimate—cubed at 1s.—is £14,380.

C. F. OVERY.

ges of Death Watch Beetle in old Oak of Church at Wensley, Yorks.

PRESERVATION OF ST. PAUL'S CATHEDRAL

Sir,—Mr. Harvey begs the questions in my previous letter. Neither his censures on me, nor his remarks on other individuals or schemes, throw any further light on the point at issue, viz., Mr. Harvey's knowledge of St. Paul's Cathedral, his qualifications as a critic, and the mutilation of the building entailed, I contend, by his alternative scheme.

There has been ample time and opportunity during the last three years for him to prove the practicability of his scheme by proper illustrations, and evidence from the actual construction of the building, for which purpose, on his own showing, he has sufficient information, instead of merely asserting his own competency. I submit that an architect having a genuine desire to help, and believing he had found a solution of the problem of St. Paul's Cathedral which would ensure its preservation, would have done this.

Mr. Harvey appears to have wasted this valuable time in repeating a slogan : That his is the only right view and scheme of preservation, and that every other opinion and proposal for the repair of the Cathedral is wrong. To support these contentions he devised and published in his book and elsewhere a diagram, Figs. 19 and 21, with which he has illustrated his opinions in articles in the Press There can be no doubt from the editorial comment on these articles that the public have thereby been misled.

Manifestly he has formed his opinion on the condition of St. Paul's Cathedral on the construction shown on Section A, Fig. 1, of the accompanying drawing, which is copied from his book, Figs. 18 and 21, and which he describes as " Section through Transept of St. Paul's on line of great pier," and explains that it illustrates how the " Inner drum I.D. and the Whispering Gallery W. at St. Paul's stand out over the void, and their weight is conducted on to a small portion of the pier top by Pendentive P. The load reaches the Pier," at corner A, " not only in a concentrated form, but with a dangerous overturning tendency," and on page 30 he again repeats that " the great inner drum stands out several feet over the internal space between the piers." I have added a plan, Fig. 2, and a stress diagram, Fig. 9, at corner A, to show this imaginary construction more clearly.

It is difficult to understand why Mr. Harvey has not found out in the time which has elapsed since his book was published the discrepancy between this section and his other illustrations, Figs. 32 and 33 cross and longitudinal sections, or that he still believes that this diagram correctly represents the structure as it exists. But since in his letter he refers me to his book for information regarding it, I can only suppose that he is still as much in the dark about St. Paul's as when he drew the diagram and wrote his book.

Nothing of the kind exists or has ever existed in the Cathedral. Fig. 3, section B, shows the actual construction of the building in the same position as Mr. Harvey's section A. The portion which " stands out over the void " in the building and in the unknown section is shown (Fig. 4) stippled, and the bearing of the walls on the pier in each case is cross-hatched.

No wonder Mr. Harvey declines to give any calculations or dimensions. Had he attempted to do so he would have found that the inner drum and part of the walls connecting it to the outer drum, according to him, stand out over 9 ft. at the centre of the pendentive on a radial line, Figs. 1 and 2, and at least 5 ft. over the keys of the coffered arches, Figs. 5 and 6, and that this overhang, which weighs something like 13,000 tons, is corbelled out as shown for the whole circumference.

He would also have seen that the superficial area at the base of the wall in his diagram, supported by the pendentives, is 2,016 sq. ft., whereas the inner wall as built stands out in eight places only, about 14 ft. long in each case, and for a distance of 2 ft. 5 in. at the centre, at the top of the pendentive and having a total area of 140 sq. ft. only out of its full base of 1,416 sq. ft., the remainder having a direct bearing upon the piers and supports below.

By comparing his illustrations as I suggested, he would have seen that on his diagram, section A, the back wall has been advanced 7 ft. from its true position towards the front of the piers, and occupies the position in which the front wall actually stands. The effect of this mistake is to represent that a load of some 8,700 tons is 7 ft. nearer the critical corner of the pier than it really is.

Further, if he had compared the bird's-eye view of St. Paul's—Fig. 34 of his book—with section A, he would have realised that the piers do not end in the triangular buttress shown, but are carried up as seen on section B, Fig. 3, and form massive buttresses to the circular walls and extend as footings over the whole area of the pier and distribute their weight well back on to the piers, as pointed out in the final report of the 1921-25 Commission. This bearing is shown cross-hatched on the plan, Fig. 4. The bearing surface is therefore some 207 sq. ft., instead of being a point load, as he supposes, on an area of 84 sq. ft., also cross-hatched on the plan, Fig. 2.

Mr. Harvey is equally mistaken with regard to the " springing of the great arches being designed in a manner which concentrates pressure on one corner of each pier." Apparently he fails to grasp the construction shown in Fig. 40, page 67 of his book, because it is " fragmentary " and does not show the extent of the pier. If, however, he had drawn the section through the pier correctly, he would not have fallen into this error or mistaken ornamental for structural work.

He suggests as a cure for this hypothetical disease a reinforced concrete cone which is designed to transfer a great part of the weight of the inner drum, approximately 1,200 tons per pier, from the front, where the pier is strongest and constructed to carry it, to the back, where the pier is weaker and is not designed to support more load than it does at present. This is merely borrowing from Peter to pay Paul.

But a considerable part of the weight of the cone itself is added, and a large proportion of the weight of the peristyle and its drum wall, which at present rests fairly near the middle of the pier. The upper part of the wall, which is cut off by the cone and rests as a concentrated load half-way up the cone, must be transferred by it to the back of the pier, unless Mr. Harvey intends to prop up the cone from the pier below.

The cumulative effect of this would be to overload the pier far more than at present, and to increase the local intensity of stress at the back of the pier to nearly double that which it is at present at the front of the pier.

The weight of the concrete cone and its arch-like supports is approximately 5,500 tons, exclusive of any ribs or diaphragms for reinforcing the counterforts and staircases or other oddments of the building which are amputated or operated on. Its cubic content would be approximately 83,650 cubic ft. Its superficial area would be something like 30,000 sq. ft., *i.e.*, about three times the area of the church floor covered by the dome at present.

He claims that this construction is designed " in accordance with the principles of archæological conservation and of sound structure " and by " adopting the principle of a cone-shaped support that Wren himself designed and used at a higher stage of the building " (page 70).

This does not seem very clear. I am not aware of any precedent for what appears to be the most redoubtable patch and prop that has ever been proposed. It is difficult to see how an inclined construction in compression twice as long as the vertical support, and with a point load central, can be regarded as designed on any principle appearing in Sir Christopher Wren's designs, or that it is sound construction to carry it in this way instead of on the vertical pillar which Sir Christopher Wren built.

The mutilation of the building, which appears to be necessary for the erection of the cone, is shown on Figs. 5 and 7, and needs no comment. It is not, however, what is required. A word of four letters would define how much of the dome area would be left after the preliminary shoring had been completed.

I submit that the condition of St. Paul's and the work of preserving the building and criticism of this work are far too important and serious matters to be treated lightly. A great responsibility rests both on those who are engaged on the work and on their critics. They are engaged in difficult and arduous work, and are entitled to all the support which public confidence can give. Proposals which undermine this, unless supported by conclusive proof and carefully weighed scientific reasoning, mislead the public and are unfair both to them and the public generally.

In a matter of this kind the individual is of no importance. The evidence which he gives is all that matters, and it is on that alone that it must be judged. It is not consistent with professional etiquette to advertise, and in any case I do not consider St. Paul's Cathedral suitable for this purpose, and therefore should remain

Inquisitive.

THE SURVEYORS' INSTITUTION

THE ROYAL AND MEDIÆVAL TOMBS IN WESTMINSTER ABBEY.

In the course of a lecture on this subject before the Surveyors' Institution, on Monday evening last, Mr. Lawrence E. Tanner, M.A., F.S.A. (Assistant-Keeper of Muniments, Westminster Abbey), said the most important of the royal and mediæval tombs in the Abbey was, of course, the great shrine of Edward the Confessor. It was made, as the inscription told us, in 1268, by Peter, a Roman of the Cosmati family, at the command of Henry III. In that year the body of the Confessor was solemnly translated from its original resting-place in front of the high altar and placed in this shrine by the King himself. With the solitary exception of the very interesting little shrine of St. Candida in the village church of Whitechurch Canonicorum, in Dorset, it was the only shrine in England which survived the Reformation almost untouched and still contained the body of its saint. The shrine itself is of purbeck marble, and was once covered with glass mosaics, of which a few fragments still remained. At one end stood two twisted pillars supporting figures of the Confessor and the Pilgrim. These pillars had been displaced, and now, half-buried, supported the reredos slab at the back of the altar. The top, or feretory, was of gold, but this disappeared at the dissolution of the monastery in 1540, and the existing wooden top (perhaps a copy of the original) was made by Abbot Feckenham during the short-lived revival of the monastery under Mary Tudor. It was difficult for us to imagine the magnificence and beauty of this shrine in its original state.

The tomb of Henry III. occupied the middle bay on the north side of the Confessor's Chapel. It was designed by Peter the Roman, who designed the shrine, and dated from about 1291. Like the shrine it was composed of purbeck marble and mosaic work, and slabs of porphyry. On the north side much of the mosaic remained, and from one of the side chapels it was possible to get a very fair idea of a mediæval tomb in all its splendour. Seen from this spot the tomb was some 12 or more feet high, but it would be noticed that up to a point roughly corresponding with the reach of a man's arm the mosaic had entirely disappeared.

Almost exactly contemporary with Henry III.'s tomb was that of his daughter-in-law, Eleanor of Castile, the wife of Edward I. The gilt bronze effigy by William Torel was, perhaps, the loveliest thing in the Abbey. On the ambulatory side there were traces of a painting by Walter of Durham on the stonework, depicting a tomb with mourners and Edward himself kneeling in prayer to the Virgin Mary. Above was a beautiful wrought-iron screen, made by Thomas of Leighton Buzzard. This in course of time was removed, but was found and replaced in its original position by Sir Gilbert Scott.

In striking contrast to these three wonderful tombs was the perfectly plain slab of black purbeck marble, resting on a base of Caen stone, which marked the resting place of Edward I. Its great size—for it was over 9 feet long—and the complete absence of decoration made it singularly impressive and no unworthy memorial of one who was essentially a man of action. It had been suggested that the tomb was left thus in accordance with the dying wish of the King that his bones should not be buried until Scotland was finally subdued, but more probably it was left unfinished by Edward's faithless and thriftless son.

To Edward we owed the link which bound the living to the dead. The Coronation Chair, in which every sovereign had been crowned since Edward II., was made in 1300-1301 to enclose the Stone of Scone. The chair, which was of oak, and cost £5 in those days, was elaborately painted by Master Walter, the king's painter, but little of his work now remained. It was only within the last hundred years or so that it had been properly treated; before then any might sit in it who would. The back was covered with names—many, he was afraid, of 18th-century Westminster boys.

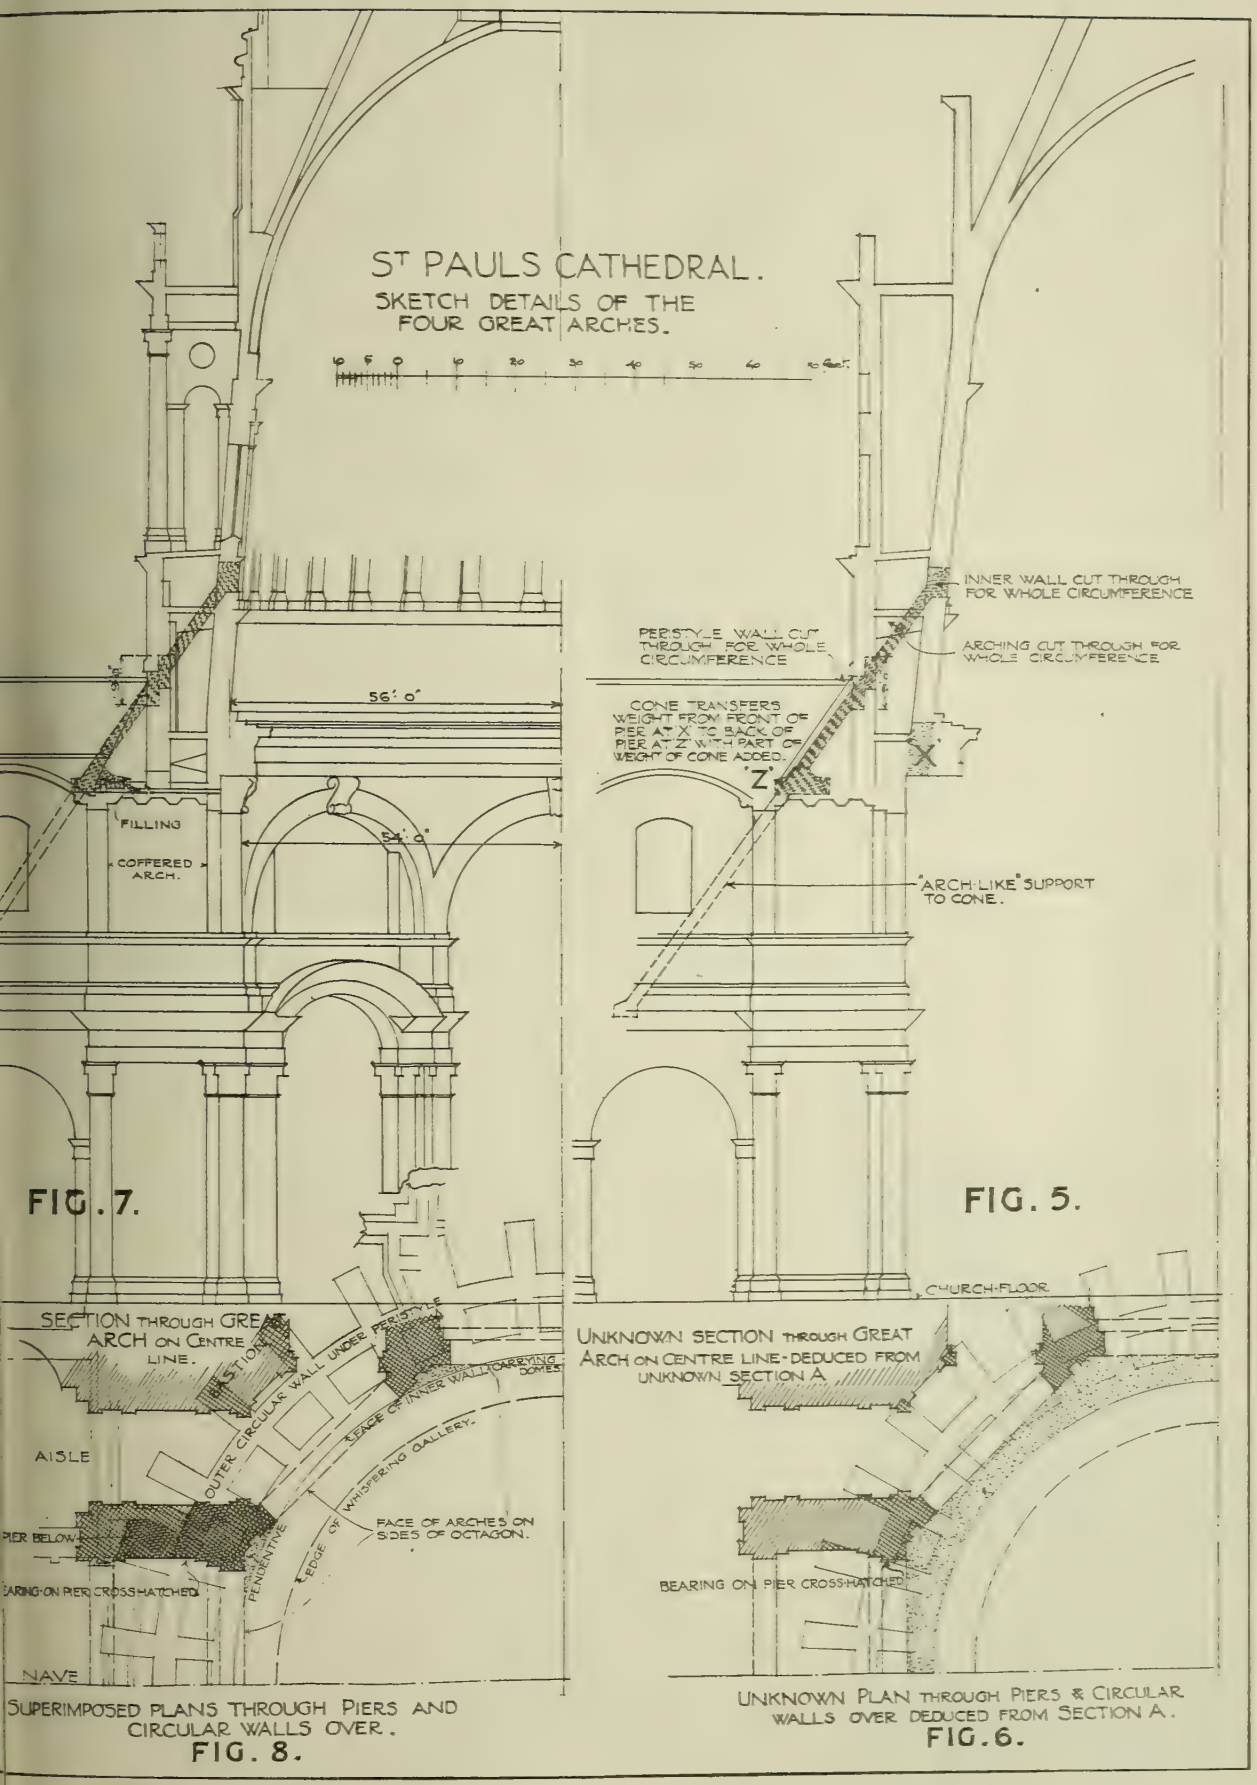
Next to Edward I., but separated from him by the later altar screen, was the fine altar tomb of his brother, Edmund Crouchback, titular King of Sicily, and Earl of Lancaster (d. 1296). The tomb, with its triple canopy, was made by Alexander of Abingdon, "le Imagour," and represented in stone the temporary hearse which was always erected in front of the altar at great mediæval funerals. It was originally painted all over, and recent cleaning had brought to light much of its former colour. Next to it was the somewhat similar tomb of his cousin, Aymer de Valence, Earl of Pembroke (d. 1324), son of that William de Valence, half-brother of Henry III., whose tomb (with its fine shield of Limoges enamel) was in one of the side chapels. Beyond, again, was Crouchback's wife Aveline (d. 1273), heiress of the Albemarle and De Redvers families. These three noble tombs were all about the same date, and might even be by the same artist. In front of them was the great mosaic pavement brought by Abbot Ware from Rome in 1268. Underneath it were buried three queens—Edith, wife of Edward the Confessor; Maud, wife of Henry I.; and Anne, the daughter of the Kingmaker and wife of Richard III. Opposite was yet another queen, Anne of Cleves.

On the south side of the Confessor's Chapel stood the black and white marble tomb made in 1369 by Hawkin of Liège to commemorate Queen Philippa of Hainault, the wife of Edward III. The face of the effigy was evidently a portrait. The tomb had been much mutilated, and of the figures with which it was once enriched, two alone survived. The marble work of the tomb was made by Henry Yevele, who designed the nave of the Abbey.

Between Edward III. and the altar screen was the large tomb of Richard II. and Ann of Bohemia. She died in 1394, and the tomb, which was designed by Henry Yevele, was made shortly afterwards under the King's personal direction. The gilt-bronze effigies made by Nicholas and Godfrey de Wodestreet might therefore be taken as authentic likenesses.

Henry IV., although he died within the Abbey precincts, had perhaps little wish to lie beside his immediate predecessors. His remains were interred, as he had himself directed, near to those of his uncle, the Black Prince, in Canterbury Cathedral. It was otherwise with his son. Henry V., from the first years of his reign, took the deepest interest in the Abbey, which he enriched with many gifts. At the east end of the Confessor's Chapel he himself planned a chantry chapel, which by an ingenious design was made to extend as a kind of bridge over the ambulatory beyond. In order to obtain room for it it was necessary to encroach on the tombs of both Queen Eleanor and Queen Philippa, but this fact was not one which disturbed the mediæval mind. Henry died in France in 1422, and his funeral was one of the most magnificent which had ever taken place in the Abbey The greatest master mason of the time, Thurske, began the chantry chapel. All that remained of the effigy on Henry's tomb was now a headless wooden trunk. In 1545-6 the plates of silver gilt which covered it and the solid silver head were stolen; and although the thieves were caught, the damage was never repaired. But the chantry was but little injured. It was reached by a double stair from the Confessor's Chapel, and was formerly used both as a chapel and as a relic chamber. On a beam above could be seen the shield, saddle and helmet which were carried at Henry's funeral. The sides of the chantry were covered with sculptured figures of saints. On each side were depicted the scene at the coronation o King, and there was also a represent of Henry himself in full armour on back. These were probably the authentic portraits of Henry in exist Above the altar were full-sized figur St. George and St. Denis, represe Henry's claim to the throne of France

Underneath the altar was Katherine of Valois, Henry's queen. had been buried in the old Lady C but on its demolition her body was wr in a sheet of lead and placed by the of her husband's tomb. After having temporarily buried elsewhere in the A she was finally buried in the chant Dean Stanley in 1878.



Among the Abbey muniments there been preserved an intensely interesting ment, which contained the sworn d tions of several persons who were pr on more than one occasion when the A was visited by Henry VI One of heard the King say, "Is it not fittyng I shulde have a place to be buryed in nyghe to Seint Edward where my fade all my auncetors beth buryed?"

But in spite of his wishes the "dered saint" was to be buried, not at minster but at Windsor, and his memorial at the Abbey was the long w ing scratch of Thurske's (the mason's) axe (to mark the place for the tomb) o stone floor which was seen and iden nearly 450 years after this interesting by the late Mr. Westlake and the lect Even the chapel which Henry VII pla in his honour, and to which he purp to transfer his remains, was event turned into a place of sepulchre Henry VII. himself. The wide nave of chapel showed that it was Henry's or intention to place in the centre of it great tombs, one for Henry and one for self. The chapel was built from 15 1519, but before it was complete it w receive the remains of the King's m Margaret Countess of Richmond (d. The Abbey had few more beautiful t It was by Pietro Torriagiani, and he ha trived to put into the bronze effigy a dignity of a great and gracious perso

The tomb of Henry VII. and Elizab York, from the same hand, was m remarkable as a work of art, but its bronze screen prevented it from properly seen by the ordinary visitor was a wonderful Renaissance tomb, v in every way to rank with similar to Italy. It formerly had an altar at it end, and was finished by Torrigiani in The contract for the tomb was still pre amongst the Abbey Muniments. In th vault Dean Stanley found the coffin o James I.; the reason for its interm this place remained a mystery. At th end, under an altar made up of fra of the original altar, rested Edwar The altar was destroyed in 1643. Elizabeth and Mary, Queen of Scots both buried in the side aisles of VII.'s Chapel. These monuments erected by James I., who made th stipulation that the monument to hi mother should be rather more magn than that to the queen who had sign death warrant.

The tomb to Elizabeth, with the exc of the one designed to hold the be Edward V. and his brother, which found in the Tower in 1674, was th memorial to a sovereign erected at minster. A name and date cut on th were the only memorial of James Anne of Denmark, Charles II., Willia Mary, Anne, George II., and Caroline. For a few brief years Cr Blake, Desborough, and other Ce wealth worthies, were suffered to rest Abbey.

The funeral of George II., so inir described by Horace Walpole, was t interment of a sovereign in the Church: but in 1925, for the first ti nearly 200 years, the body of a queen in the Abbey for a few brief hours the final interment at Windsor.

Flats, Exhibition Road, Kensington.

The site of these flats is situated in the part of the grounds of the Royal Geographical Society formerly Lowther Lodge, Kensington. The plan includes six flats on each of six floors, with varying types of accommodation. A main staircase and lift serves each pair of flats, with a back stairs and service passenger lift. Efforts have been made to produce a plan with the minimum amount of corridor, and in which the service between the kitchen and dining-room is as direct and convenient as possible. Bathrooms communicate with the principal bedrooms or have doors in close proximity. There are considerable differences in level in the ground, which have added to the difficulty of creating an economical building. The elevation will be executed in purple facing bricks with stone dressings. The roof will be covered with green slates or tiles. The drawing-room in each flat will have a coal-fire, the remaining fires being electric. The flats have been planned in accordance with instructions received through Messrs. Lane, Saville and Co., estate agents. The main building contract has been secured by Messrs. F. G. Minter, Ltd. The electrical equipment will be by the Berkeley Engineering Co.

Messrs. T. P. Bennett, F.R.I.B.A., and Son are the architects.

Christ Church Cathedral, Victoria, B.C.: Ambulatory.

MR. J. C. M. KEITH, Architect.

Royal National Orthopædic Hospital (Country Branch), Starmore.

The new buildings for this hospital were commenced about twelve months ago, and comprise the following blocks of buildings :—

1. Three large open-air ward blocks, the long axis facing south with sanitary annexes at the east and west ends—the back portion in the centre containing sectional administration quarters with small kitchen, etc., linen rooms, staff lavatories and teachers' rooms. A feature of the wards is that the whole of the south front is permanently open, while in the lower part of the mansard roof is a roof light running the full length of the building and glazed with Vita-glass. In front of each block is a wide solarium.

2. Surgical block, containing two large wards and four single-bed wards with the usual sanitary annexes and administration offices. At the north end of this block is the surgical and operating block, containing theatre, wash-up and sterilising rooms, also large plaster room with drying room and plaster store off same. In this section there is also a surgical store and pathological room, as well as surgeons' dressing and bathroom. The surgical portion of this block is warmed by panel heating, and a feature is the special sterilising apparatus, enabling all sterilising bowls to be used from the theatre but eliminating the objection of steam in the theatre.

3. Main kitchen block, which serves the whole of the new buildings, consisting of the kitchen, with the usual sculleries, and stores adjoining, as well as a sitting-room for staff. The first floor consists of bedrooms for maids.

4. Nurses' Home, a building with three floors, containing 40 bedrooms and connected with the existing old buildings.

The architects are Messrs. H. F. Murrell & R. M. Pigott, FF.R.I.B.A., of 44, Bedford-row, London, W.C.1; and the contractors, Messrs. Ekins & Co., of Great Northern Works, Hertford. The following were sub-contractors :—Messrs. Benham & Rosser & Russell, heating; Crittall & Co., iron windows; Carter & Co., terrazzo and tiling; Lawford & Co., asphalt; W. T. Lamb & Co., Roman tiling; Leeds Fireclay Co., sanitary fittings; James Hill & Co., ironmongery; Mellowes & Co., lantern lights; Stuarts' Granolithic Co., granolithic; Drake & Gorham, electric light; Redpath Brown & Co., steelwork.

Christ Church Cathedral, Victoria, B.C.

Building operations were commenced last year on the new cathedral at Victoria, British Columbia. The total length of the cathedral proper will be 305 ft., and seating accommodation will be provided for about 1,400 worshippers. The west front, with a total width of 113 ft., will face down Courtney-street, and will have an uninterrupted view for the whole distance from Douglas-street to Quadra-street. The two towers, each 33 feet square, will rise to a height of 135 ft., and in one of them will be hung the bells which it is hoped may one day form part of the cathedral equipment. The other could well contain a single bell of great size for use on special occasions. Between these great towers will be an arch, 83 ft. high, somewhat similar to one of the great arches on the west front of Peterborough Cathedral, while under this and in a deep recess will be the main entrance doorway, with a large "rose" window, 25 ft. in diameter, above it. The towers will each have two doorways and will form additional porches affording direct access to the north and south aisles, and the north and south ambulatory passages, as well as to the central vestibule. The central tower will rise 185 ft. above the level of the nave floor.

The main entrance leads into a vestibule 37 ft. by 14 ft., which in turn gives access to the nave, and the north and south porches. The stone-groined roof vaulting is 80 ft. high, and the nave is divided into six bays width between the north and south pie 37 ft., and a total width from the nort the south walls of 93 ft. 4 in. On the s of the nave, and close to the west en the semi-octagonal baptistery, 18 ft. The organ pipes will be carried on screens of three bays on either side of choir stalls. The length of the crossing north to south (including the choir) is ft., and the transepts are each 34 ft. wid 28 ft. from north to south inside. Ea the crossing is the presbytery. Other ac modation includes a memorial chapel vestries.

It will be of interest to mention that Archdeacon of Columbia, the Vene E. P. Laycock, is an architect by fession, and, prior to taking holy or he practised in London, having been art to Messrs. King and Lister, of Plymouth was in partnership with Mr. W. H. Ja of London.

Mr. J. C. M. Keith, of Victoria, B.C the architect, and Messrs. Parfitt Brot of Victoria, B.C., are the contractors.

The Northern Counties Club, Newcastl Tyne.

This club building was erected by Gra to the designs of the famous Newcastle a tect, John Dobson. The lounge occupie ground floor of an adjoining building, was acquired to enlarge the club pre many years ago. This room was without architectural character, having a marble place and other features characteristic o mid-Victorian period. The room had formed by knocking down the partitio tween two apartments, and had a very doorway as access. It was desired to a doorway more in scale with the apar and to give the room a more fitting dignified architectural character.

The scheme was somewhat modifi execution, notably in the substitution o antique "Adam" fireplaces for those on the drawing. These "Adam" fire were presented by a member and came the Old Assembly Rooms in New About ten coats of paint were removed them. The walls and woodwork of the are decorated in stippled parchment the fireplaces have stone hearths and dog-grates; on the floor is a large old carpet, and chair coverings and curta of green shot with dull red. The cont were Messrs. T. Curry and Sons, of castle, and the architect was Mr. K Glover, F.R.I.B.A., of Newcastle.

Bedford Grammar School.

An appeal has recently been made governors of Bradford Grammar Sch £185,000 to defray the cost of erecting school on the Clock House Estate, M ham, to replace the existing inadequat ings at the junction of Manor-row an ningham-lane. We illustrate this perspective view of the proposed new ings.

Messrs. Petch and Fermaud are th tects.

SOCIETIES AND INSTITUTIONS

LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

In an address to this Society on December 7, Mr. Howard Robertson, F.R.I.B.A., said architecture to-day was slowly emerging from a state where the function of building for a purpose had been obscured by sentiment and false values. The aim of building was not to show the cultural outlook of the designer, but to solve a problem efficiently and agreeably. The wants and requirements of an age which made incessant demands on human energy had not been met in architecture with any degree of understanding.

In this country too often the designer of buildings was acting as a brake on progress. He thought in terms of the past, a display of culture and a smattering of historical knowledge were his baggage, he was averse to supplying ways and means for meeting requirements which his client often formulated, but which he was unable to translate into terms of practicability without his architect's support. For this reason the architect in this country took a secondary place, instead of becoming, as in America, a planner who could place his knowledge of design at the service of manufacturers for the organisation of their industry, of municipalities for the solution of their civic problems, of hotel keepers for the better service of their guests, the architect remained the executant of the layman's ideas; his creative ability too often was limited to the solution of given requirements; to the nature of the problem he contributed little. In the United States the architect held the unique position of adviser to the community. In this country he was merely the interpreter of the client.

In every country in Europe, and even in England, it had been discovered that architecture had for many years ceased to be a living art. And to-day the reaction had set in, and we found ourselves on the verge of an epoch of emancipation. It was an epoch in which we found ready to our service a vast accumulation of knowledge and data; books, pictures, industry, and scientific skill were all available. We might to-day stand on our own legs, and feel that, with the immense progress of science to assist us, we could cease to solve our problems of designing buildings in the old-fashioned way which suited the simple needs of our forefathers.

Architecture evolved, that much was true; but the evolution took place under the creative impulse. The new architecture which was being evolved to-day was crude and disturbing, but we must remember that it was only a phase in a long-term forward movement. It was sometimes said that these movements died, that the "Art Nouveau" was dead, that "Arts and Crafts" was dead. This was not true; the spirit and the effect of those movements lived to-day in a modified form. To-day the plastic quality of Art Nouveau was revived in cubism; the Arts and Crafts movement was translated into the slogan of the D.I.A., "fitness for purpose." No veritable movement died; it was merely translated into other terms.

That was what had happened abroad, where in Holland the Dutch Renaissance had its own modern renaissance in the finely modelled brick fronts of the new housing and commercial buildings. The small-paned windows had yielded to plate-glass; the crowstep gables were replaced by the cubist forms which were natural to steel and concrete; the narrow vertical fronts of the individual houses were replaced by the long horizontal façades of the mass dwelling.

In France, the cramped and stuffy rooms, with their draped windows, their bad boiseries, their pretentious echoing of the glories of Mansart or Gabriel, were giving way to a saner conception of the home for a 20th-century being, heated, spacious, light and airy, and economical of upkeep. The solution was yet to find, but there was satisfaction in knowing that at least the architect was aware of the problem, and that he was groping towards a solution.

Sweden was tackling the problem with skill and grace, while the designer in Denmark was first a gentleman and then an architect. In Germany they were fertile in invention, bold and skilful. They were not afraid to make mistakes; they realised that prettiness was a very minor virtue. In England we had not realised that ugliness and grandeur were very often close cousins. Our sham half-timber, our period trimmings, our wreaths and swags and urns and cupids and crockets still obsessed us. And, worst of all, we were parsimonious in art, though we realised in other matters that the dearest was generally the best.

Fortunately the public interest was growing; but while architects did not sing the praises of their buildings, and were ashamed to acknowledge their work or that they lived by their work, they could never expect to hold the public interest. Publicity for works of art was not degrading; on the contrary, it tended to suppress the bad artist who revelled in anonymity; it provided the human interest. And without the human interest no art would long command attention or retain vitality.

SOUTHEND-ON-SEA AND DISTRICT SOCIETY OF ARCHITECTS.

The annual dinner of this Society will be held on December 15 at the Queen's Hotel, Westcliff, at 7 p.m. Mr. Walter Tapper, A.R.A., President of the R.I.B.A., will be present as chief guest, supported by the Mayor and Mayoress of Southend, together with the Mayor of Colchester, and Mr. A. E. Piper, Mayor of Colchester in 1926. There will be a representative gathering of the profession from all parts of Essex at the function. Prior to the dinner a meeting of the executives of the branch societies of Colchester, Romford, Chelmsford and Southend will be held to discuss the constitution of the New Essex Society of Architects and to elect the president and council of that newly formed body. In a sense, therefore, the dinner, whilst forming the first annual dinner of the Southend Society, will constitute the inaugural dinner of the New Essex Society.

ARCHITECTS', ENGINEERS' AND SURVEYORS' DEFENCE UNION, LTD.

The following statement appears in the current issue of the *R.I.B.A. Journal*:—

It would seem that the circular "A" issued by the Defence Union containing information relating to its objects has conveyed to some members of the Institute the idea that the Union is an organisation formed outside of, and in some way in rivalry with, the R.I.B.A. Possibly this is due to the fact that the Union is a separate body and that its offices are at 28, Bedford-square and not at Conduit-street. However this may be, the Council of the R.I.B.A. desires to remove any misapprehension and to state that the Architects', Engineers', and Surveyors' Defence Union, Ltd., was formed under the auspices of, and with the sanction and support of the R.I.B.A., and has permission to indicate this in its circulars.

The Council of the R.I.B.A. urges all eligible members of the Institute who have not yet joined the Union to do so without delay, and as a matter of course, not only in their professional interests, but with the object of establishing firmly a defence organisation founded by members of the Institute and carried on under the auspices of and with the hearty support and approval of the Council. All communications relating to the Defence Union should be addressed to 28, Bedford-square, London, W.C.1, where accommodation has been placed at its disposal by the Council of the Institute.

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND

THE first annual general meeting of Council for the Preservation of Rural Eng was held on Tuesday at the Royal Insti of British Architects, Conduit-street, Lord Crawford and Balcarres, president the council, presided. The officers of council and the executive committee w unanimously re-elected for the coming y

The annual report, which was adop shows that in addition to the constitu organisations there are 41 affiliated socie A study of the causes and remedies of r desecration has been undertaken, and report points out that the study of exis powers may reveal certain gaps which it be necessary to fill by new legislation. general conclusion so far arrived at is there are ample powers, but that many them are not used because of some small c culty or misunderstanding experienced by responsible authorities. A simplified form planning scheme is considered essential the whole country, and the council will sho issue a proposal which will contain a sl amendment to the Town Planning Act, 1 an amendment which, it is hoped, may affect the title of the Act. One of the fu mental objects of the council is to incr the holdings of the National Trust and o bodies. A scheme is being considered supersede the frequent practice of eleve hour purchase of land at exorbitant price at prices which can be obtained for build A systematic survey of England will be m of those particularly beautiful parts wi have a small value agriculturally, and a pc laid down by which these may be acqu either wholly or their essential uses sec for the public. There is no reason, why reserved land adopted for the pur should not be cultivated to the fu possible extent.

The council is formulating a combined pc of constructive help in design and cri control for the suppression of outrage. the former purpose it is hoped to set up vo tary panels of architects who will be prep to give advice and guidance to inten builders and local authorities. For the la there is the model clause drafted by Minister of Health, giving statutory po of rejection, which can be put into opera by means of a town-planning scheme. L Crawford, moving the adoption of the rep said the council had had a strenuous active first year. There were many signs the public were becoming alive to the h ships inflicted on them by reckless attack rural England. They had been in corres dence with clubs, societies, and movem scattered all over Britain during the pas months, and one of their great difficul incidental to such institutions as theirs, been that of finance. If they could secure help through subscriptions he would guara that their work would gain enormously its efficiency. Professor Patrick Abercron honorary secretary, who seconded the a tion of the report, hoped that eventually whole country would be covered with a work of local preservation societies. T had decided that it would be advisabl take tracts of beautiful country and estal committees which would be miniatures of council itself, and the Thames Valley was first area selected. Mr. E. Guy Daw A.R.A., vice-president of the council, although they had been in existence onl months they had created a volume of pu opinion throughout the country that no c society with similar objects had achieved. The great thing they had c contend against was finance. It absolutely essential that they should more money.

It was decided that the council should twice yearly.

PARTHENON STUDIES.—X.

By W. R. LETHABY.

THE METOPES—*continued.*

EN the figure of Aphrodite and that on the metope and on the vase is ing Eros (Fig. 10). Of the figure of the metope, enough remains to show was very like the figure on the vase. e, then, that the vase painting cer- presented the Parthenon sculpture, ering all the evidence together, we onsiderable knowledge of a very panel. To bring back a noble type odite by Pheidias, and perhaps er shoulder is quite a romantic to be found in these dry-as-dust For good illustration of the vase, full bibliography, see Mr. A. B. *ens*, Vol. II. p. 1044. Two Attic he Louvre also show Menelaus pur- ien, Nos. 229, 424; in the latter he face and drops his sword as Helen nd Eros flies between them (see *Vases*, I, 218, 282).

is thought that possibly the metope arthenon was not the source for the nting. "If the vases recall the nner of Pheidias, this may be owing nfluence which affected sculpture as ase painting. This would explain same composition is rendered on two of the Parthenon and upon a vase me period. The vase, however, re- tho, the companion of Aphrodite, her place on the metope appears a ace companion of Menelaus" (*A of Discoveries*).

mpanion of Menelaus may be asso- think, with a third metope, which on the left to the pair we have been . A vase at Bologna, which has ng of Menelaus and Helen (Reinach, , has on the left, and in continua- at subject, the discovery of Aethra phon and Achamas, an incident in g of Troy. One of these two men ne warrior behind Menelaus on the while the other warrior, together ra, may have occupied the metope he left. This metope is described contained a male, who seems to dden surprise from a woman. The the recognition of Aethra by the k warriors was popular in vase as the references in Reinach's com- ill show. The one mentioned above arly interesting, as the part of the representing Helen and Menelaus be a variant of the Vatican Athena substituted for Aphro- possibility thus emerges that the Aethra and the two Greeks on the suggested by the metopes. An in the British Museum has this

as, describing the painting at the Sack of Troy, says: "When taken, Aethra stole out of the camp. was recognised by the sons of Now, if what Michaelis calls "a ace companion of Menelaus" on the is one of the brothers who counted other incident, that would explain ase painter put Peitho (Persuasion) As Michaelis leaves the subject, ains a question: Why was the ace man put into the metope instead utiful figure of Peitho?

iting this I have found that Malin- ested that Briseis appeared in this nd that Praschniker objected: "In nce we would rather suggest the Aethra's being brought home by or Akamas" (Vienna, *Jahreshefte*,). The subject is the recognition by the two warriors, one of whom figure behind Menelaus on the metope. We thus reach the conclu- not only did one subject occupy es, but that there was continuity veral in this part of the flank at comparing the illustration given by Michaelis of this metope with a sketch made by Dr. Ortières in 1686 (Fig. 11), it will be evident that the same piece is represented. Another subject which is likely to have been represented in such a cycle is the attack of Ajax on Cassandra. Now there is a broken metope (P) which contains traces of two figures which may have represented this subject. Nearer the centre still would probably have been the death of Priam.

The metopes we have been considering were in the right-hand half of the north flank. On the left hand also the subjects related to the Trojan war. The first panel of all contained a chariot, probably that of Athena. The next showed a ship—representing the Greek fleet; it had a curved prow and a large steering oar; against the

FIG. 11.

side is a ladder by which a man has descended. The ship is in low relief, and the approach to "landscape" treatment is so far from archaic that if the panel were not on the Parthenon it would be argued that it could not possibly be there. The probability is that some battle scenes followed, and that incidents of the sack, including the death of Priam, were in the middle. Some distance to the right of the Menelaus and Helen metopes was one (29) on which was a fugitive on a falling horse (see *Greek Buildings*, 1908). The penultimate metope on the north side seems to have contained a winged figure standing before a female—we might guess Athena with Nike (Victory); possibly it is Nike turning away from Hera. Certainly Athena appears in the next and last panel. In this is sculptured a dignified goddess seated on a rock, while a girlish figure approaches her. There are no attributes, but I suggested before that the position of the arms of the seated figure look as if she might have carried a helmet in her right hand and held a spear in the upraised left. She is not merely seated on the rock, but her right foot is raised and planted on it, and the rock is of the form of the Acropolis as it appears on coins of Athens. On one of the metopes of Olympia Athena is seen seated on a similar rock. The Museum

FIG. 12.

Guide, 1924, will not commit itself to more than saying it is "a conversation between two female figures." That the dignified figure seated on the Acropolis is Athena may not be doubted (Fig. 12). She has no armour as being at home with her own people; it is her Sabbath rest after the strife. The graceful figure who trippingly approaches Athena holding her mantle is so like a figure on the Pergamon copy of the basis of the Parthenos that it is certain they derive from a common inspiring source, probably the mind of the same artist. Schrader allows that this basis copy is evidence for the relief style of Pheidias, and comes very close to that of the Parthenon frieze, which he would assign to Alkamenes. At this point I referred to a study of the Parthenos I made ten years ago (*Hellenic Jour.*, 1917), and find that I had already noticed the resemblance. I thought that the figure on the basis and two companions represented the three Graces. "This action is found on the west metope of the south side of the Parthenon; it appears to signify arrival or departure. . . . Here Athena is seated on the Acropolis rock. She is probably conceived as having returned from the Trojan war, the final scenes of which are treated on the other metopes. A messenger-like figure trips up to her who is not Nike or Iris, and who resembles very closely one of the figures on the basis of the Parthenos. It must be Hebe or a Grace." I would now substitute Eirene for Hebe.

In *Greek Buildings* I gave a sketch from a vase of a figure of Athena seated on a rock watching the fall of Troy. (Compare Reinach's *Vases I*, pp. 244, 251, in which Nike runs up to Athena with a wreath, 331 and 446.)

This last metope on the N. side is one of special beauty and full Pheidian style. The maiden who approaches Athena gathers her drapery with her hand lowered behind. The youth of the Eleusis relief makes the same gesture, while the seated Athena of the metope is vested like the right-hand figure of the same relief (Fig. 7). There can be little doubt that both sculptures are by the same master. The image of Athena in the old temple seems to have been of this type.

I have before pointed out that the priestess in the E. frieze of the Parthenon was attired in the same way, and that the torch of Demeter in the same frieze was similar to one in the relief. It is curious that it is as difficult to determine which is Demeter and which is Persephone in the Eleusis relief as in the E. pediment. For yet another Pheidian characteristic in the Eleusis relief notice the creases in the necks of the goddesses.

West Front.—The more general interpretation of this series is that they represented the Battle of Greeks and Amazons; some, however, have thought that the Greek victory over the Persians at Marathon is a more probable explanation. I agree with the latter for reasons given in 1908.

Leake, as far back as 1821, thought that these sculptures "related to the warlike exploits of the Greeks. The dress of the vanquished pedestrian in No. 1 [from the right] and the shield in No. 5 seem to be Persian." Hawkins, in *Museum Marbles*, expressed the view that these metopes referred to the Athenian victory at Marathon. Collignon suggests that an Amazon battle was represented, but it "recalled Marathon."

In *Sculptures of the Parthenon*, 1910, we are told: "The subject is generally taken to be a battle of Greeks and Amazons. Unfortunately [for this theory?] there is none of the extant figures which is clearly female. The rider of No. 1 is uncertain. The kneeling figure in XIV might be an Amazon, but it might also be an Oriental barbarian. Elsewhere, so far as judgment can be formed, the figures appear to be masculine." Of No. 1 we are told further: "On the original the form seems to give a more decided impression of femininity than on the cast, and the figure may be an Amazon, but it cannot be regarded as certain." I can hardly agree to this statement about the original metope, as the artists who have drawn it—Pars, Le Bas, Laborde draughtsman, and Penrose—all make the rider look like a Greek warrior. It is out of reach at the Museum, but several years ago I carefully examined another cast

at Berlin, and am convinced that it is a male figure, an Athenian knight, and not an Amazon.

These western metopes are for the most part in very bad condition, as the photographs in *The Sculptures of the Parthenon*, 1910, show. They are there compared with Mr. Ebersole's notes of his close examination of the originals. The second metope, following that with a mounted warrior, has a pair of combatants on foot, and the alternation

FIG. 13.

continued throughout, with the possible exception of No. 5, which is so badly decayed that it seems impossible to assert anything of it. Michaelis thought there were traces of a horse. As alternation would give a pair fighting on foot, and not a rider, Mr. Ebersole decided that the evidence suggested two warriors on foot with a rock in the middle.

Such strict alternation may be doubted, and it is not unlikely that near the centre of the series there was a group of three metopes with horses. The slight indications on Dalton's drawing (1749) perhaps suggest a rider rather than two men on foot. (In 1908 I gave a sketch of a drawing by Pars at the Museum as of this metope, but I appear to have mistaken No. 5 for 8.)

By comparing what exists with the drawings of Pars (which do not seem to have been made use of in *Sculptures of the Parthenon*) and the minute but careful little record given by Dalton, fairly accurate restorations of several panels could be made. Fig. 13 gives the general type of the groups with a horseman, after Dalton's etching. It should be observed that the rider in every case is victorious, yet according to the Amazon theory the vanquished would be a Greek.

1. The victory at Marathon was represented together with the Amazon battle and the War of Troy, in the painted portico at Athens. It was also represented in sculpture on the Temple of Nike. There, indeed, the mounted warriors appear to have been Persians, but the victory is obviously with the Greeks. According to Michaelis, the pediment sculptures at Ægina celebrated the Greek victory at Salamis.

2. The Parthenon was itself a monument of Victory, and it seems unlikely that such a recognised subject would be ignored.

FIG. 14.

3. The alternative subject, the Amazon battle, was represented on the shield of Athena within the temple. There the Amazons were fighting on foot, as would be reasonable for their siege of the Acropolis. On the west front they are supposed to be the mounted figures; in this case it can hardly be the siege of the Acropolis, but some battle nowhere in particular.

4. The one mounted figure, which is well known from a cast, seems, as said above, to be male. It is unlike Amazons on the shield.

5. The mounted figures in every case are victorious, while any Amazon battle represented on the Parthenon would certainly be a defeat of the women warriors and not their victory.

6. These metope groups of a warrior riding down a foe were copied again and again on soldiers' tombs. The type became a common victory formula, appearing even on many Roman tombs in Britain. The mounted figure of Dexileos, 394 B.C., on an Athenian gravestone, is practically copied from these metopes (Fig. 14). It is difficult to think that this would have been possible if the originals had been Amazons. There is a cast of the tomb of Dexileos at the Museum, and it would be informing to have it and a cast of the metope No. 1 set up side by side. Compare this metope (W. 1) with an early relief of a Greek horseman illustrated by Mr. A. B. Cook in the *Hellenic Journal*, 1917, and refer to the later mounted warriors on the sarcophagus of Alexander. See also Le Bas, pl. 60, for

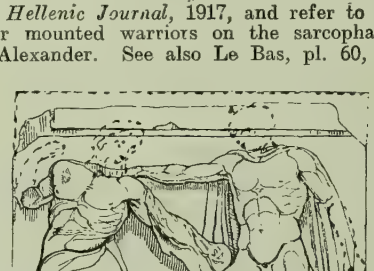

FIG. 15.

a mounted man with a spear, which closely imitates the metope; also a coin of Amynta in Gardner's *Types of Greek Coins*, pl. vii. The rider on the metope must have carried a spear; in this case no enemy is present, although in every other metope which had a rider there seems to have been a fallen foe also. The chief difficulty in accepting the view that the western metopes were a memorial of Marathon seems to have been a doubt in regard to the use of cavalry at that battle. That mounted soldiers were employed by the Greeks when the Parthenon was built is sufficiently proved by their appearing in the frieze. Perhaps the riders on the metopes were the young knights of noble blood attached to the hoplites (see Guy Dickens, *Cat. Acrop.*, Museum, p. 140).

The whole cycle of Parthenon sculptures dealt with Athena's gifts to Athens and the victories of her people. To her was ascribed the crowning victory over the Persians at Marathon.

A special study of a score of the metopes, together with restored drawings by a competent draughtsman, would be much of a revelation, extend our knowledge of Pheidias, and sweep away all thought that these wonderful panels were in any degree archaic. The first need is to rediscover the originals in the British Museum after their century of banishment, and to put them on exhibition. During this time they can hardly have been really examined more than once, when, about forty years ago, for the purpose of the *Catalogue of Sculpture*, ladders must have been set up. Of the first one, in the Museum, for example, it was then noted that [illegible] clasps the head of the Centaur "[illegible] left arm, pressing the fingers of his [illegible] against his windpipe. The Centaur [illegible] head forced back, his mouth wide [illegible] if uttering a cry of agony. His left [illegible] which the fingers remain, endeavours [illegible] lodge the grasp on his throat; the r[illegible]

FIG 16.

grasps the right shoulder of the [illegible] This so-called "Lapith," I suppose, [illegible] fact meant for Theseus, and it would [illegible] if we could study all the evidences o[illegible] The recesses, high on the wall, whe[illegible] priceless marbles are now placed, r[illegible] occupied by full restorations of those [illegible] be most surely completed; thus the[illegible] be a double gain (Figs. 15-16). S[illegible] restoration as adding parts for wh[illegible] drawings of 1674 furnish evidenc[illegible] practically complete several, and, a[illegible] gested before, it is likely that som[illegible] London Art Schools would underta[illegible] public and educational work if caste[illegible] formation were provided for the [illegible] Some day, when a fairly general ag[illegible] towards which we are all the while a[illegible] ing, has been reached, it will be po[illegible] give an account of the Parthenon [illegible] sculptures without these tiresome ar[illegible]

* * * *

Now, at the end, I would like t[illegible] that we should aim at knowing the [illegible] ful stones better, and get more out [illegible] than we do. From the chance th[illegible] Office," when I came to London [illegible] Bloomsbury-square, near the Museum [illegible] to know the sculptures so well tha[illegible] take them in my mind on a railway [illegible] or to bed! They have been a comf[illegible] ever since—one of the great thing[illegible] life. The marbles are housed in a f[illegible] but they should be even better sh[illegible] they are. Changes have come abo[illegible] grees, but the large question o[illegible] re-arrangement should be faced. Eve[illegible] placed far too high; it was a Victor[illegible] stition that you should have pict[illegible] hang them near the ceiling. If th[illegible] platform on which the great figure[illegible] were reduced to half its height, th[illegible] still be lifted as high as the Ægina [illegible] at Munich. The frieze is equally [illegible] but probably that must now be [illegible] except that little platforms might [illegible] here and there so that one may get p[illegible] A way of bringing the metopes do[illegible] they can be examined must be fou[illegible] fection should be sought for in the [illegible] the things and care of the room: [illegible] the marbles might be a festival, a [illegible] the Pan-Athenaic festival itsel[illegible] sionally there might be a small ex[illegible] photographs, old drawings, and o[illegible] trative material. We want to kin[illegible] siasm and to make a concerted a[illegible] understand these works of Pheidi[illegible] examine carefully theories which [illegible] put forward, and to venture out, as [illegible] scholars did, to have opinions and [illegible] on these things. Descriptions like [illegible] River God" should disappear.

hy and yearly summary of what has been
en would be very useful. Renewed
npts at restoration should be made. The
of Dionysos might be almost perfectly
red in plaster, and if that were done and
n with casts of the Laborde head and a
heads from the metopes in a group, that
d do much to establish the Pheidian type
ead. Restored versions of several of the
pes and sections of the frieze should be
, and the latter at least might be
red. If a painted and gilt version of
small, old copy of the Parthenos were
, that, too, would help us in realising
it was like.

rther, ordinary visitors require a good,
general account of the sculptures with-
many details or arguments, but written
understanding and admiration. For such
pose, nothing is likely to be found better
the relevant part of Lechat's *Phidias*,
what condensed. I will make an end by
ng what he says of the great master
tor. "All the past seems to have been
ied up by him—the school of Argos,
paintings of Polygnotos, memories of the
n Treasury at Delphi, are in the frieze,
of Olympia in the metopes; there is in
western pediment something of the
na and Marsyas of Myron. Pheidias

being.

BOOK REVIEWS

A Short Critical History of Architecture. By the late H. Heathcote Statham. Second edition, revised and enlarged, under the editorship of G. Maxwell Aylwin, F.R.I.B.A. (London: B. T. Batsford, Ltd.) Price 16s. net.

When this work first appeared in 1912, its many merits were not, perhaps, fully appreciated, although it had what may be called a good Press, but its subsequent acceptance leaves no room to doubt that it supplied a want and that it has proved to be one of the most concise and eminently readable and yet critical of the shorter histories of architecture. The author's knowledge of many subjects was unusually wide, and in the compilation of this short history he was aided by a lifelong study of the subject, a sanity of judgment and a facility of expression which enabled him to produce a book which gives an admirably clear and at the same time individual history of the subject. The editor of this new edition, although not personally acquainted with the author, very truly remarks that certain of his characteristics are evident from the form and manner of his writing, "from which we gain an impression of learning, industry, sincerity and impulse," from which it is inferred that, "possessed at once of these two last qualities, not only would the author have found it possible to modify certain of his convictions as expressed in the first edition, but that he would have wished to do so had he been spared to experience the trend of modern thought." Those who have been privileged to know the author will agree with Mr. Aylwin, and will be glad to know that it has been his aim to treat the second edition exactly as he believes the author would have done, and we may add that we believe the author, had he been spared to see this second edition, would have been quite satisfied that the work had fallen into such safe and sympathetic hands. The author aimed at presenting the story of architecture in a connected, interesting and readable form, not cut up into disconnected styles, but as a gradual development. It is also a *critical* history, and the author was not afraid to comment on the design or detail of ancient buildings in a frank and searching manner, with the result that the work is an exceptionally interesting handbook of the architecture of the past. In the new edition, whilst the main narrative remains unchanged as regards treatment and planning, some important revisions have been made in light of the scholarship of the intervening years. A number of illustrations have been added, now bringing the total to over 600, including illustrations of some of the finest achievements of recent times. The work has always been, and still is, of real value to students of architecture, and is likely to be a lasting memorial of its author.

English Gothic Churches. By Charles W. Budden. (London: B. T. Batsford.) Price 7s. 6d. nett.

Many books have been written about church architecture. Most of them provide opportunities for text-books upon the usual development and sequence of the Gothic styles from Saxon to Perpendicular. The author has contrived to give us something quite different. In the introduction he gives an able and broad summary of the main characteristics of Gothic art, whereas throughout the book he is chiefly concerned with the examination of detail. Bearing in mind the point of view of the layman, for whom this book is intended, there is a very great deal to be said for the author's method of handling the subject. The interest of the reader is maintained throughout, and this is high praise. For ourselves, we like chapters 2 and 3 in particular. In these the author discourses upon the various types of churches in mediæval England, although it is with the typical English parish or greater churches that he is especially concerned. The book is well illustrated.

Christ Church Cathedral, Victoria, B.C.: View of Nave during Construction.

Mr. J. C. M. Keith, Architect.

(*See page* 896).

LIABILITIES OF ARCHITECTS

THE case Wisbech Rural Council *v.* Ward (1927, 2 K.B. 556), which we noted in our issue for July 29, has been carried to the Court of Appeal, where the judgment delivered by the Court below, holding the architect liable, was unanimously reversed (see *The Builder*, November 25).

It will be remembered that the defendant was acting as architect in a housing scheme being carried out for the plaintiff Council by contractors, and that under the building contract the Ministry of Health had rights in connection with the scheme as they could compel the user of certain war material which the Disposals Board had for sale. Clause 29 of the contract provided amongst other things that no money should become payable to contractor unless and until the amount was certified by the architect, and when work to the value of £250 had been executed, and thereafter at monthly intervals, the amounts payable to the contractor should be notified at the rate of 90 per cent. of the value of the work, including authorised extras and day work executed and materials delivered on the site up to the first day of the month in which payment was to be made, and the balance of 10 per cent. was to be carried to a retention fund, and when the retention fund reached the sum of £467 10s. then the contractors should be paid monthly to the full value of the work executed. The clause then proceeded: "One half of the retention fund shall be paid (subject to the conditions set out herein) to the contractor at the completion or occupation of the works, and the other half, together with any further sum found due to the contractor at the final adjustment of the accounts by the quantity surveyor, shall be paid four months after completion or occupation of the works, provided that all defects for which the contractor is liable are made good and that he has otherwise discharged his liabilities under the contract." It was also provided that no certificate of the architect except for the final balance should be considered conclusive evidence of any works or materials to which it related nor to the value thereof nor should it relieve the contractor from his liability to make good any defects as provided by these conditions nor should it in any way prejudice the employers in the final settlement of the accounts in any case where the contractor had been overpaid during the progress of the works.

In giving the interim certificates the defendant by mistake in some cases had given certificates as to certain articles which overlapped certificates for articles supplied by the Disposals Board, so that the plaintiffs had paid both the contractors and the Disposals Board for the same articles, and this was the cause of complaint in this action. This mistake was admitted by the defendant frankly in his evidence. The subsequent events are described as follows in the judgment of the Court in the court below. "After considerable delay, which was due to the fault of the defendant, the parties endeavoured to get a final settlement of the accounts, and as late as October, 1923" (the contract had been entered into on September 30, 1920, but no date is given in the report as to when the works were completed), "the defendant went through the accounts with some of the plaintiff's officials and in effect admitted that he had made a mistake. This is shown by the document entitled Summary 4. He did not deny the correctness of the sums paid twice over and promised to obtain a refund from the builders. The plaintiffs gave the defendant an opportunity, at his request, to recover the amount of the money if he could. Unfortunately the builders dissolved partnership and one went bankrupt. The present writ was then issued to obtain the overpaid money from the defendant."

At the trial the first point raised for the defendant was that the defendant was acting as a quasi-arbitrator, and therefore in the absence of fraud was not liable, and in the Court below the decision really turned on this point, the Court holding that the defendant was not acting as a quasi-arbitrator in giving these interim certificates but as agent for the plaintiffs and that he was liable for negligence. The Court of Appeal did not enter into this question but reversed the judgment on other grounds, so it is necessary to refer to the other defences. These were: That the action was premature because there was power to rectify until a final certificate and no final certificate had been issued. Should a final certificate be issued it would be found that the builders had not been overpaid because a similar sum was due to them for increased wages; if the matter could not be rectified there had been a final certificate in Summary No. 4, the document gone into between the parties to find what the exact position was; and this being a final certificate the defendant could not be sued for negligence; lastly the plaintiffs had also been negligent for not checking and keeping accounts. The Court below had held that there was no power to rectify, by reason of the delay of the defendant and the change in the circumstances of the contractors and no sum was due as alleged to the builders; that the summary was not a final certificate or issued by the defendant as such and that the plaintiffs had not been negligent.

The judgments in the Court of Appeal are very shortly reported at present, but the reasons on which the appeal was allowed appear to have been—That the Court below had failed to appreciate the effect of clause 29, relating to interim certificates, as it had treated the interim payments as though they were final payments adjusting the relations between the parties. There had been no final adjustment, and in that sense the action was premature. The effect of Summary 4 had also been misunderstood, but the evidence of the defendant was justified when he called attention to the fact that on the face of it that document, which had been examined and corrected by the Clerk of the Council, showed that a sum of £270 to be paid was less the amount payable to the Disposals Board; the defendant, as architect, was bound to certify for the full amounts of both labour and material, and he had shown that a certain amount was to be deducted.

Until all the judgments delivered in the Court of Appeal are reported, we are unable from the short report available to explain clearly the effect of the judgments. It is not easy at present to say whether the only finding was that the action was premature, or whether the Court also treated "Summary 4" as a final certificate.

Town Planning.

On Tuesday evening last, Mr. Ernest E. Allen, F.R.I.B.A., M.T.P.I., delivered a lecture entitled "What Town Planning Means," before a well attended meeting of the Maldens and Coombe Ratepayers' Association, at the Graham Spicer Institute, Malden. He outlined briefly the history of town planning from earliest times, and dwelt in some detail on what can be accomplished under the Town Planning Acts, and afterwards showed an interesting collection of slides illustrating his points.

An opportunity was given to ask the lecturer questions, and from the number who took part it was evident that a very considerable amount of interest is displayed in the subject by local ratepayers.

In replying to the vote of thanks, Mr. Allen said he was surprised to learn that it was proposed to provide only some 27 acres for public open spaces in the local scheme, and pointed out that for the present population an area of 72 acres was not too much, and that for the estimated population something like 400 acres should be the figure aimed at. Mr. Allen recently gave a similar lecture to the boys of his old school, Bootham, York.

THE SPIRIT OF FRENC GOTHIC

Sir Banister Fletcher, F.S.A., F.R.I.B. in his lecture at the Central School of A and Crafts on November 30, described extraordinary developments of Gothic arc tecture, as seen in the cathedrals of Fran He showed how the sombre and solid Rom esque gave way to the light and grace Gothic, and how this energetic and restl style of architecture was well suited to French national character, which revelled solving the problem of producing buildi in equilibrium. By balancing stone u stone in pier, vault, and buttress they pensed with solid walls and filled their pla with gigantic traceried windows of blaz stained glass. The whole idea of the Got style was growth springing from a cent germ, and putting out fresh features as n arose, and this opened up almost limitl possibilities of transforming the structu parts of a building into its chief adornmer

During the Gothic period, from the beg ning of the thirteenth century, Fra covered herself with cathedrals. The z which prompted their erection changed face of France, much as industrial life covered England with railways and factor Lantern views of Notre Dame, Pa Chartres, Laon, and other cathedrals sho that the association of architecture and sc ture was brought to a perfection that never been surpassed. The lecturer descri French characteristics, such as the chevet, rounded east end and cluster of chap which, except at Westminster, did not oc in England.

New Railway Bridges.

Originally built in 1872, the South Railway high level bridge over the Medway, at Maidstone, has been re structed, the great task of laying the ton steel floor being completed between night of Saturday and the early hours Tuesday. The preliminary work had b going on for some months past, says *Times*, and during this time the bridge to be temporarily supported on a he timber staging erected on piles over river. The original brick piers have been extended and the two old bow-sha girders replaced by two new lattice s girders. The concluding stage of the construction, begun on the previous S day, of the bridge spanning the G North Road at the North end of Grantha and carrying the L.N.E.R. main line tween London and Scotland, was compl on Sunday without interference with senger traffic. Goods traffic was diver A steel structure replaces the cast-i bridge which has done service for th quarters of a century. The girder, we ing over 80 tons, for the down section, put in position a week ago, and the ot for the up section, was put down on S day, the work being done in each cas seven minutes.

Scheme for Municipal Hot Water: Par

The Paris Municipal Council has deci says the *Morning Post*, that the city s be supplied with heat in the same wa it is supplied with light and water. In years over 7,000 flats will be warmed municipal current and receive a cons supply of municipal hot water, while in years no doubt people will no more t of heating their homes with fires or cen heating installations than they woul getting their water from a private pu The company to whom the concession been farmed has undertaken to begin within a year. The first heating sy will in all probability extend from B to the Opera. It is expected that munic heating will be considerably cheaper private heating, since almost any kin fuel can be employed.

WEEK IN PARLIAMENT

Westminster, *Wednesday.*

A Housing Commission.

Mr. Harris asked the Prime Minister what swer he had given to a recent deputation king for the appointment of a Royal Com- ssion to inquire into the whole housing oblem; if he proposed to appoint a Royal mmission; and, if not, whether he pro- ed to appoint a special committee to re- t on the subject at an early date.

Mr. Baldwin said the suggestions of the putation which waited on him had been y carefully considered, but having regard all the circumstances he did not think t the appointment of a Royal Commission a special committee would assist in the ution of the housing problems. An official ort of the proceedings of the deputation l appeared in the Press.

Rural Housing.

Mr. Everard asked the Minister of Health ether, in the case of all those county ncils who had not submitted schemes der the Housing (Rural Workers) Act, 6, before the end of the present year, he ; prepared to declare that the rural dis- t councils should be the authorities for administration of this Act.

Mr. Chamberlain said that in 12 of the 16 es in which county councils had not sub- ted schemes, some or all of the district ncils had been declared the authorities er the Act; in the remaining four cases matter was under the consideration of county councils, and he hoped that they uld decide to submit schemes. If it uld be necessary, Mr. Everard's sugges- would, of course, receive serious con- ration.

House Rents.

Mr. Looker asked the Minister of Health ther he was taking any steps to secure erection of houses to be let at rentals not eeding 10s. a week, inclusive of rates.

Mr. Chamberlain said he had already sug- ed to local authorities that they should uture especially devote themselves to the vision of houses which could be let at s within the means of the less well paid kers, and the reduction which had taken e in the prices of houses was undoubt- facilitating the erection of this type of se.

Scottish Housing.

Mr J. Gilmour informed Mr. Westwood up to date 62 local authorities in Scot- had submitted to the Scottish Board of lth schemes under the Housing (Rural kers) Act, 1926, which had been ap- ed by the Board. As at September 30 the latest date for which the informa- was available, grants had been pro- d in respect of 206 houses amounting to ,966 19s. 10d., and a loan in respect of house, amounting to £100.

Mr J. Gilmour informed Mr. Potts that ng 1914-1926 the recorded number of ses erected in Scotland with State assis e was 52,936. No accurate record was lable of the number of houses erected in land during the same period without e assistance, but it was estimated that veen 1919 and 1926, inclusive, the num- was approximately 10,415.

School Buildings.

iss Lawrence asked the President of the rd of Education whether he was aware in more than one elementary school in don the classrooms had been remodelled he basis of 10 square feet of floor space older children and nine square feet for nts, instead of the 12 square feet for r children and the 10 square feet for nger children required by the Board's ding regulations of 1924; and had that urture been sanctioned by the Board.

Lord E. Percy replied in the negative, and said that all recent plans for remodelling London elementary schools, with one minor exception, had been on the 12-10 square feet basis. The regulations referred to applied only to newly erected premises, and were not, therefore, necessarily applicable to the remodelling of existing premises.

Protection of Beauty Spots.

Sir H. Brittain asked the Under-Secretary to the Home Office, as representing the First Commissioner of Works, whether he was aware that, in beauty spots and in the region of interesting historic towns in Germany, regulations existed with regard to the erection of buildings which might tend to disfigure the neighbourhood of such national treasures; and whether he would consider the possibility of strengthening existing legislation for the protection of national monuments and enlarging it to include the more famous beauty spots in this country.

Sir W. Henderson said that the First Commissioner accepted the statement as to the existence of those regulations in Germany, into the working of which he was making inquiry. While he shared the views of Sir H. Brittain, he feared that it would not be possible at the present time to promote legislation involving additional expenditure.

Built-up Areas.

Mr. Viant asked the Minister of Health whether he could make a statement as to whether he was prepared to introduce legislation to amend the Town Planning Act so as to enable local authorities to include built-up areas in their town planning schemes?

Sir K. Wood said that the Minister hoped to introduce legislation on that matter, but could not at present say when it would be possible to do so.

Slum Clearances.

Mr. Chamberlain informed Rear-Admiral Beamish that 112 schemes for the improvement of unhealthy areas had been submitted, of which 105 had been confirmed since January 1, 1919. On October 1 last, action had been taken by local authorities in respect of 91 schemes, 10 schemes had been fully completed, and others were nearing completion.

British Bricks.

Mr. Hacking informed Mr. Somerville that the number of bricks of brick earth or clay returned for purposes of the Third Census of Production as manufactured in Great Britain in 1924 was 4,184 millions, and the quantity of tiles of all kinds was 574,000 tons.

Steel Houses.

Sir J. Gilmour informed Mr. Hardie that on October 31 last the number of steel houses that had been erected with State assistance in Scotland was 2,583.

Houses Built.

Sir K. Wood informed Mr. T. Thomson that up to the 1st inst. 690,881 houses had been erected with State assistance under the various Housing Acts. Of that number, 301,198 had been erected by private enterprise and 389,683 by local authorities.

Slum Clearances.

In the House of Lords on Monday, the Bishop of Southwark inquired when the Government proposed to introduce legislation to facilitate the clearance of slum areas. The slums were so large in extent, so terrible in their conditions, that they might very easily prove a real menace to the welfare of the country.

The Bishop of London also spoke of the problem of the slums, and urged that the L.C.C. and the local councils should take action in the matter.

Viscount Gage, replying on behalf of the Government, said the slum problem had not been neglected. Encouraging progress had been made. Not only in London, but in many other large centres of population, the local authorities had been energetic in dealing with their black spots. Since the Armistice, 105 schemes had been confirmed by the Ministry of Health, and others were under consideration. In the 34 years before the war, since the passing of the Housing Act of 1890, which gave local authorities power to deal with slums, only 44 improvement schemes, and 28 reconstruction schemes were confirmed. The London County Council had been particularly energetic in tackling the problem, and had made substantial progress since 1919. Eleven schemes of magnitude had been confirmed, and the City Corporation and Metropolitan boroughs had formed twelve schemes, making in all 23 schemes for the Metropolis. Other large schemes for the Metropolis were under consideration. The Exchequer subvention of an amount up to one-half of the average annual loss on slum schemes, including the first cost of rehousing, was available for local authorities which undertook such schemes.

As to the Government's intentions, the Ministry had authorised him to say that the problem must be tackled in a more comprehensive way if any considerable improvement was to be effected within a reasonable time. The very large number of houses now being completed annually must ultimately relieve the overcrowding problem, and the time was surely not far distant when local authorities would be able to turn their energies in a greater degree to the slums. Although the powers of local authorities for dealing with the slums were wide and far-reaching, it might be possible to introduce a further measure which should be practical and effective in helping those people who were now living under such unsatisfactory conditions. The scheme at present under consideration was one whereby houses in an unsatisfactory area which might be saved by the expenditure of a little money would be reconditioned, and only the houses which were past redemption would be demolished. By judicious use of powers on those lines the Minister considered that bad areas might be opened up and improvements effected in a much shorter time than it would take to clear the whole area. Another matter which was being considered by the Minister was the question of the basis of compensation payable on insanitary property acquired in connection with slum schemes. The Minister was not in a position to indicate precisely the time or nature of the legislation, but the whole matter of the slums was receiving his most earnest consideration, and he would make a statement on the subject when his purposes were in a more definite form.

Imported Bricks and Tiles.

Asked by Mr. Somerville if he could state the causes of the large progressive increase in quantity and value of imports of bricks and tiles, and whether he had made any inquiry into the question whether this increase was in any degree due to restriction of output and cost of transport in this country, Sir K. Wood said that the Minister of Health was aware that the imports of both articles had risen considerably in recent years, though in the case of bricks they appeared still to be very small as compared with the home production, which had also shown very considerable increase. The question of the price of bricks and tiles in this country had been continuously under review by the committee on the prices of building materials, but the Minister had not received any reports which would indicate that the factors referred to had had special influence on the volume of imports.

Imported Granite.

Sir P. Cunliffe-Lister informed Major Owen that the imports into the United Kingdom of granite setts and granite pavement curbs amounted in 1924, 1925 and 1926 to 233,000 tons, 176,000 tons and 127,100 tons respectively. The corresponding values were £613,100, £504,400 and £346,700.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Measuring Painting on Sash and Frame.

[REPLIES TO "MEASURING," NOVEMBER 25.]

SIR,—In Banister Fletcher's "Quantities" it is stated that sash frames and sashes are numbered, and the sash squares are afterwards reduced and billed at per dozen, stating whether large or small squares:—

Sash frames: per No.
Small frames: per No.
Sash squares: at per dozen.

In the same book the method of measuring in the north (Manchester) is given as: "Windows to be measured each surface, over full size of opening, for painting frame and sheets, or else the frames counted and the sheets of large squares counted."

"Quantities," by Davis, in *The Builder* Students' Series, states: "Window frames number. Take both sides. If over 24 ft. super. describe as 'large'; over 36 ft. as 'extra large'; squares at per dozen."

The "Scottish Mode for the Measurement of Painter Work, 1915," has: "Windows—case and sash windows may be measured by the super. yard, stating the number, the measurement being the daylight size. The number of panes shall be stated."

The "Glasgow Mode of Measurement, 1835"—now superseded by the Scottish Mode—had: "Sashes in extra small panes by super. yard.—All glass in panes exceeding 18 in. wide and 4½ ft. super. shall be deducted, less an allowance of 4½ in. for cutting round same."

In all cases both sides should be measured.

ARCHIBALD WELSH.

SIR,—If it was agreed that the painting should be measured at per yard super. inclusive, this should be the basis of the settlement, but if this cannot be established the method of measurement should be in accordance with the Standard Method of Measuring.

MEASURER.

SIR,—The correct way of measuring the painting on a sash and frame is as follows:—

No. 2.—Sash frame, superficial area about 17 ft. 6 in. super, at .....

No. 16.—Squares.

From the above it will be noticed that both sides of the sash and frame are measured.

Another way, and perhaps the best for your correspondent's purpose, is to super the sash and frame over all, say, 4 ft. by 5 ft. 6 in. = 22 ft. = 44 ft. for both sides, divide by 8, say, 5 yards super. On no account must any deduction be made for glass, etc.

C. F. H

Services of an Architect.

SIR,—I notice that the Scale of Charges issued by the R.I.B.A. shows that the full scale includes the service of preparing an approximate estimate by cube or otherwise. Can you tell me whether it is essential for the architect to prepare and submit such an approximate estimate, whether asked to do so by the client or not, and if so, whether failure to do so, although the client has not asked for it, implies that the architect has not given his full services as covered by the full scale of charges?

ARCHITECT.

Recovery of Fees.

[REPLY TO "NON-MEMBER," NOVEMBER 18.]

SIR,—The Institute Scale of Professional Charges is not binding in law, but is generally taken as a basis of assessment for professional remuneration. It may be taken that a court of law will recognise that a professional man is entitled to reasonable remuneration for services rendered efficiently to instructions. But cannot Non-Member become a member for future benefits?

MEMBER.

Water-Closet Connections.

SIR,—A plumber is experiencing difficulty in making a watertight connection between the water-closet basin and the stoneware drain pipe. I shall be glad if you will suggest the best and most satisfactory method of making a good water-tight joint between the two. I should also like to know the best method and material to use for making a joint between the "S" or "P" trap of a water-closet basin and lead elbow or copper pipe.

QUERY.

Efflorescence in Brickwork.

SIR,—Could you suggest a means of preventing the efflorescence in brickwork in interior brick fireplaces, also a treatment for some which have gone very white? The bricks in question are well-known sand-faced facing bricks.

H.

Method of Construction.

SIR,—I should be much obliged if some reader would kindly advise upon the best method of construction of walls, eaves, plate, roof trusses, etc., for a roof with a 2 ft. overhang; possibly a little sketch could be given.

INQUIRER.

Question of Ownership.

SIR,—Some time ago a builder friend of mine did some reconstruction work for a client which necessitated the removal of some doors, fire-grates, etc. The builder took these away, making no allowance for them when he sent in his account. There is now some dispute about the work, and the builder asks what is his position regarding the articles he removed, as he thinks the client will demand their return or a reduction on his account to their value. Opinions would be greatly appreciated.

R. R.

Painting.

SIR,—A room at present painted a dark colour requires to be repainted cream or white. The present paint is in good condition and not blistered or perished in any way. Will it be sufficient to rub down and re-coat, and if so, how many coats will be required to cover? Failing that, will it be necessary to burn off and re-prime?

AMATEUR.

Keene's Cement.

SIR,—I have just recently seen a room plastered out with Keene's cement on a backing of lime and sand gauged with Portland cement. The result seemed perfect and no sign of blows was to be seen. The craftsman informed me he had discovered the method himself, and that he found much less efflorescence following this method than when the backing was the usual cement and sand. Have any of your readers met this in their experience, and if so, has it proved entirely satisfactory?

STARTLED.

Zinc Roof and District Surveyor.

[REPLY TO "DOUBTFUL," DECEMBER 2.]

SIR,—I take "repair" to mean the replacement of old or faulty materials with new and efficient ones, which seems to fit "Doubtful's" case perfectly. If he intended to extend the roof, or alter its form or construction in any material way, it would then become a new job, and one subject to the approval of the district surveyor.

PRACTICE.

Subsidy Question.

[REPLY TO "C. O. W.," NOVEMBER 18.]

SIR,—"C.O.W." is advised to seek an interview with the Council concerned itself, at which he should be properly represented by one who can support his figures and is familiar with the requirements anent subsidy houses. Failing a satisfactory conclusion therefrom, representations might be made, direct, to the Ministry of Health, with a view to obtaining what he desires. Here, again, he should be represented.

LAW.

HOUSING AND TOWN PLANNING

THE autumn conference of the Housing and Town Planning Council was held at the Crown Hotel, Harrogate, under the presidency of Mr. Frank M. Elgood, O.B.E., F.R.I.B.A., and ex-Provost James Norval. Over 100 local authorities in England and Scotland were represented. At the morning session the supreme importance of continuing the national housing programmes in both urban and rural districts and the desirability of a fresh housing survey was discussed.

Mr. Frank M. Elgood, who presided at the morning session, said Mr. Chamberlain only very unwillingly received the deputation from the National Housing and Town Planning Council which recently conveyed to him their hearty condemnation of the reduction of the subsidy. That condemnation was based upon their conviction that what was above all things necessary in housing was the maintenance of a steady and continuous policy and programme. They also told Mr. Chamberlain of the need of more rapid progress in making slum clearances and pressed upon him certain vital points in regard to the extension of Town Planning Acts so as to facilitate the planning of built-up areas and implementing the decisions of the regional committees. As to the subsidy it was urged that the growing uncertainty and variableness of Exchequer aid was shaking the confidence of local authorities, rendering them inclined to hold their hand about further house-building schemes, and in many cases necessitating the building of an inferior type of house. Mr. Chamberlain, said Mr. Elgood, found great fault with them for saying this, because the Ministry said they had taken no account of the fall in prices which he estimated at £45 in the case of the non-parlour house, but the National Council were by no means satisfied that the basis of Mr. Chamberlain's comparison of prices was a sound one. Local authorities, it was to be feared, were not only slowing down their housing activities, but were building smaller houses. Mr. Chamberlain seemed to encourage that because he thought it would enable authorities more effectively to provide the alternative accommodation preliminary to the clearance of slums.

Mr. James Norval described housing conditions in Scotland as far worse than those in England, and showed how badly local authorities in Scotland were hampered in housing schemes by special financial difficulties. Slum clearance was of even greater urgency in Scotland, and he would not be surprised if at no distant date the whole question of housing became merged in that of effecting slum clearance.

A succession of speeches followed in which members of the conference gave actual figures showing the reductions in building costs realised in their different parts of the country. The speakers were:—Councillor Nixon (Ramsgate), Councillor Dyson (Linthwaite, near Huddersfield), Mr. J. Barr (Building Trade Operatives), Mr. T. Howarth (Building Employers), Mr. Whittaker (City Engineer, Cardiff), Major Tresdale (Milton Hants), Mr. Walkden (Prestwich), Bailie Mackenzie (Clydebank), Bailie Morton (Glasgow), Mr. J. Rogerson (Worsley, Lancs), Mr. Shaw (Walthamstow), and Mr. G. B. Browning (Scottish Building Trade Operatives) and Mr. George Hicks. Two resolutions on town planning followed speeches on regional planning and decentralisation. The first asked that county councils should be enabled to become constituent members of joint town planning committees and to co-operate in town-planning schemes. The second asked that all local authorities without exception should be required to join in the responsibility for a town-planning scheme where the majority of authorities in any area desire to set up a scheme.

THE BUILDING TRADE

NTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—VII.

tions in Building Agreements.

passing from the subject of options ents and leases, we may refer to one fety v. Schofield (1897, 1 Ch. 937), e effect of an option in a building t had to be considered. By a build- ement dated August 12, 1895, the therein referred to as the landlord, red into a building agreement with dant by which it was agreed that vent of certain works and buildings mentioned being completed and car- as therein provided, the premises e demised for the term of 99 years tember 29 1895, at a rent of £675 first year. The agreement provided tenant shall forthwith proceed with s and will, on or before May 1, 1896, d cover in the buildings and com- nish the same fit for occupation on or une 1. 1896." There was a clause that until the demise the tenant y the rent and perform all the stipu- ontained in the agreement, and that of any breach being made" in pay- the rent, there should be power in ord to distrain. Another clause pro- hat in case the tenant shall not at ective times and in manner herein- pressed on this behalf have built and npleted" the premises, or default e made in payment of the rent or in evance of the stipulations, it should l for the landlord to put an end to ment and to re-enter and be entitled uildings or plant to be found on the

r clause contained the following If the tenant shall be desirous of g the fee simple, free from incum- (except these presents), of the said land and premises at the price of and shall at any time before 9. 1897, give the landlord . . . a writing to that effect" (on certain s not here material) then the "per- ng such notice shall be deemed the s of the premises at the price of

ember 30. 1896, the tenant served landlord notice of his intention to the above option, but the plaintiff, lord, served a notice on the tenant g to determine the agreement under e above clauses—firstly, on the ground buildings had not been completed e time named in the agreement; and, on the ground that the tenant had rthwith proceeded with" the work. ndant, the tenant, refused to give up n, and the action was brought for an tn restraining him from trespassing interfering with, the possession by tiff of the said land and premises.

gards the first ground of complaint, completion of the buildings, the Court at there had been a contemporaneous nt that the dates mentioned for cover- r completion of the buildings should ned if an extension of time could be from the London County Council for pletion of the buildings by the amount extension, and such an extension had tained, so the only question was there had been default in "forthwith ng" with the work, and the Court here had been some default in this There then remained the question ect the exercise of the option had on ion of the parties.

first place, the Court held that in eement it was not a condition pre- the exercise of the option that the defendant should not have made default under the building agreement, so the option was properly exercised and a binding contract was thereby come to between the parties for sale and purchase of the property, but the option did not destroy the leasing parts of the agreement, but created fresh rights and liabilities between the parties and a new relation, namely, that of vendor and purchaser. The vendor then became a trustee of the property for the purchaser, and the purchaser was the real beneficial owner, but the vendor was not a mere dormant trustee, but a trustee having a personal and substantial interest in the property, with a right to protect that interest. Here, however, it was held that as there was no past rent owing, and the rent up to the date of completion was expressly dealt with in the clause conferring the option (a clause not set out by us above), no paramount right of the vendor to protect his own interest as vendor required him to determine the defendant's occupation, and after the exercise of the option, and pending completion, the power of the vendor to determine the defendant's occupation (if any) and the defendant's rights and liabilities under the leasing portion of the building agreement were suspended.

Whilst touching upon building agreements, we may call attention to a point under the new legislation as to Conveyancing. Under the Settled Land Act, 1882, powers were given to life tenants to grant building leases. This Act has been repealed by the Settled Land Act, 1925, which purports to be a consolidating Statute. Section 2 (10) (iii) of the Act of 1882, which defines "building purposes" and building leases, is now included unchanged in section 117 of the Act of 1925. Section 6 of the Act of 1882 is now represented by section 41 in the Act of 1925, the term for building leases being extended from 99 years to 999, whilst section 8, which contains regulations respecting building leases, is reproduced unaltered in section 44 of the Act of 1925.

Under a short Act, the Settled Land Act, 1889, section 2, a special provision as to options in building leases was introduced, providing that an option could be exercised within an agreed, time not exceeding ten years, under the Settled Land Act, 1882, at a price fixed at the time of making the lease, such price to be the best reasonably obtainable, having regard to the rent reserved.

This Act is not repealed by the Schedule to the Act of 1925, but a similar provision, but not confined to building leases, is contained in section 51.

Assignments of Agreements and Leases.

Under the second heading of subjects to be considered in these articles, we set out "The methods by which the term can either be prolonged or determined," and we have dealt with options to renew or for a new lease and for purchase; but there remains a further method by which a tenant can to some extent determine his tenancy, and that is by assignment. This is a subject of great complication, and it would be impossible for us in these articles, with the space at our disposal, to deal with all the many points of law involved in assignments; but there have been a good many recent decisions on the effect of covenants not to assign or part with the possession of premises, and we shall mainly confine our observations to this question.

It may, however, first be pointed out that, except in the case of tenancies on sufferance or tenancies at will, there is a right to assign unless it is prohibited by the agreement or lease: this applies to weekly tenancies (Commissioners of Works v. Hull; 1922, 1 K.B 205), to tenancies from year to year (Allcock v. Moorhouse; 1882, Q.B. 366), and all tenancies except those above stated. For our present purpose it is sufficient to give one example of what is a tenancy at sufferance and a tenancy at will, taken from Redman's "Law of Landlord and Tenant," eighth edition.—If a tenant for years, or his assignee, holds over after the termination of the tenancy, or a tenant from year to year holds over after the determination of a notice to quit, they are tenants on sufferance; but if the landlord assents to their possession they become tenants at will; but if the landlord receives rent, then they become tenants from year to year. The right to assign, or sublet, or part with the possession of the property, which exists in all tenancies except those on sufferance and at will, is, however, very usually either prohibited by the agreement or lease or made subject to consent by the landlord or lessor, and it is with clauses or covenants to this effect we intend here to deal, as explained by recent cases only.

It may, however, be well to point out that in the Landlord and Tenant (No. 2) Bill now before Parliament there is a clause which, if it becomes law, will have a bearing on this subject. Clause 18 is as follows:—"In all leases, whether made before or after the commencement of this Act, containing a covenant or condition or agreement against assigning, underletting, charging, or parting with the possession of demised premises or any part thereof without licence or consent, such covenant, condition or agreement shall, notwithstanding any express provision to the contrary, be deemed to be subject to a proviso to the effect that such licence or consent is not to be unreasonably withheld, and (if the lease is for more than 40 years, and is made in consideration wholly or partially of the erection or the substantial improvement, addition, or alteration of buildings, and the lessor is not one of the bodies mentioned in section 4, subsection (1), paragraph (f)), to a proviso to the effect that in the case of any assignment, underletting, charging or parting with the possession (whether by the holders of the lease or any undertenant whether immediate or not) effected more than seven years before the end of the term no consent or licence shall be required, but notice in writing of the transaction shall be given to the lessor within six months after the transaction is effected."

In clause 24, the expression "lease," unless the context otherwise requires, means "a lease, under-lease, or other tenancy, assignment operating as a lease or under-lease, or an agreement for such lease, under-lease, tenancy or assignment"; the definition of the word "tenant" in the same section includes "any person entitled in possession to the holding under any contract of tenancy, whether the interest of such tenant was acquired by original contract, assignment, operation of law, or otherwise"; so it appears that clause 18 may apply to agreements as well as leases.

As it has been common in agreements and leases to insert covenants restraining assignment, the first part of the clause will not affect most of the decisions we shall refer to in connection with such covenants or conditions.

Proposed New City Street.

The City Corporation, at their meeting on December 1, adopted a motion by Mr. I. H. W. Abrahams, requesting the Improvements and Finance Committee to consider and report as to the desirability, in order to relieve the traffic in the City, of forming a new street, 60 ft. wide, from the railway station at Aldgate to the junction at Bishopsgate by Liverpool-street, utilising such ground over the Metropolitan Railway as might be deemed advisable.

NEW BUILDINGS IN LONDON

Archer-street.—A new wine store and bar is to be built in Archer-street, W.1, off Shaftesbury-avenue, to the plans of Mr. W. H. Winder, 228, London-road, West Croydon. The builders are Messrs. Thomas & Edge, Cross-street, Woolwich, S.E.

Beak-street.—Nos. 39-47, Beak-street, W.1, are to be extensively reconstructed and modernised. The builders are Messrs. Townsend, Ltd., 24, Dean-street, W.1. The architects are Messrs. Holcombe & Betts, 21, Portman-street, W.1.

Brixton.—DWELLINGS.—The City Corporation have accepted the amended tender of Cropley Bros., Ltd., for erection of dwellings for constables on the Freemen's School site, Brixton. The cost is estimated at £169,008.

Camberwell.—CHAPEL. — The Camberwell Borough Council are about to invite tenders for the erection of the chapel and other buildings at the New Cemetery. The architects are Sir Aston Webb & Son.

Carnaby-street.—The "Coach and Horses" public-house, in Carnaby-street and Canton-street, W.1, owned by Messrs. Mann, Crossman & Co., Ltd., is to be reconstructed. The builders are Messrs. Turnbull & Sons, 9, Northumberland-alley, E.C.3. The architect is Mr. W. Stewart, F.R.I.B.A., Newlyn House, 4-5, Aldgate, E.C.1.

Cheapside.—Work is to be put in hand shortly upon the rebuilding of the shop and office premises at 39, Cheapside, E.C.2.

Chelsea.—TENEMENTS.—A scheme has been prepared by the Chelsea Town Council for the erection of blocks of tenement dwellings at the back of Cheyne-walk. The scheme, which includes an area of one and a quarter acre, is still in its early stages.

East Ham.—TENEMENTS.—The East Ham Council has accepted the tender of Messrs. Martin & Pearce at £12,798 for the erection of 12 double-tenement houses in Flanders-road and Park-avenue.

Great Windmill-street.—New business premises are to be erected at the corner of Great Windmill-street and Smith's-court, W.1. Plans have been prepared by Messrs. Yates, Cook & Darbyshire, 43, Great Marlborough-street, W.1, and the contract has been placed with Messrs. John Willmott & Sons (Hornsey), Ltd., 40, Tottenham-lane, Hornsey, N.8.

Hanover-square.—Premises at 16, Hanover-square, W.1, have been secured by Messrs. the Bank of Liverpool and Martins, Ltd., for a new branch. The alterations are being supervised by Mr. Gordon Jeeves, 16, Hanover-square, W.1.

High Holborn.—The Pearl Assurance Co., Ltd., have acquired a large site to the west of their head offices in High Holborn, W.C.2 which is to be used for a large extension of the building. The architect to the company is Mr. H. Percy Monkton, F.R.I.B.A., 32, Walbrook, E.C.2.

Highgate.—ADDITIONS. — A tender, estimated at £13,450, which has been submitted by Messrs. Blyth, Ltd., of Loveridge-road, Kilburn, N.W.6, has been accepted by the St. Pancras Board of Guardians, for additions to the Highgate Hospital, Dartmouth Park Hill, N.19. Messrs. H. V. Ashley & Winton Newman, FF.R.I.B.A., 14, Gray's Inn-square, W.C.1, are the architects. The quantity surveyor is Mr. Hugh Watkins, of 13, Gray's Inn-square, W.C.1.

Holloway.—Work is to be started in the New Year upon alterations to Bedford Hall, in Downham-road, N., including new sanitary accommodation. The architects are Messrs. H. & F. Worrow, 70, Basinghall-street, E.C.2.

Judd-street.—An extensive addition to the warehouse premises in Judd-street, N.W.1, is to be made by the Salvation Army, to the designs of their architect, Mr. Oswald Archer. Mr. J. Coxhead, Wanstead, E.11, is the builder. The steelwork is being erected by Messrs. Redpath, Brown & Co., Ltd., 3, Lawrence Pountney-hill, E.C.4.

Lewisham.—HALL.—Mr. T. Knight has submitted plans to the Lewisham Borough Council which have been approved for the erection of a parish hall in Southvale-road.

Leyton.—HOUSES.—Mr. D. W. Beck is to erect 54 houses, 33 being in Peterborough-road and 21 in Canterbury-road. The plans have been passed by the local Council.

Newington Butts.—RECONSTRUCTION.—The Elephant and Castle Theatre, S.E.1, is to be reconstructed. Messrs. Sprague & Barton, of 60, Haymarket, S.W.1, have the preparation of plans in hand.

Princes-street.—PREMISES.—Messrs. Goodman & Co. have the demolition work for the further extension to the Midland Bank well in hand. The old premises, which are being pulled down, are in Princes-street, Bank, E.C. Sir Edward Lutyens, R.A., and Messrs. Gotch & Saunders are the architects.

Walthamstow.—STUDIOS.—New film studios are to be built in connection with the expansion of British Filmcraft, Ltd. Capt. G. Banfield, 245, Wood-street, Walthamstow, is general manager of the firm.

Wimbledon.—Extensive additions are to be effected to the accommodation of the Wimbledon Hospital in Thurston-road, Wimbledon, S.W., at a cost of about £15,000. The builders are Messrs. W. Moss & Sons, Ltd., North Circular-road, Cricklewood, N.W. The architect is Mr. J. Stewart Thomson, A.R.I.B.A., 49, Hill-road, Wimbledon, S.W.20.

LAW REPORTS

Releasing a Cargo of Bricks: Claim on a Post-dated Cheque.

IN the Mayor's and City of London Court, before the Common Serjeant, Sir H. F. Dickens, K.C., recently, a claim was made by Messrs. C. Hoffmann & Co., shipbrokers; 11, Hart-street, Mark-lane, E.C., against Messrs. Hurley & Maffey, builders' merchants, 54, New Broad-street, E.C., for £69 due upon a post-dated cheque given by the defendants.

Mr. R. T. Hayward was counsel for the plaintiffs, and Mr. S. Duncan represented the defendants.

Counsel for the plaintiffs said the cheque had been given by the defendants, and payment stopped. In those circumstances it was for the defendants to satisfy the Court that the conditions under which it was alleged the cheque had been given were not complied with. The defendants' case was that they were not responsible for the demurrage claimed, and that it was due from the Continental Lines, Ltd., who had chartered the vessel in question without their authority. The post-dated cheque given by them was not to be paid until a settlement had been arrived at between themselves (defendants) and the Continental Lines, Ltd. The matter had never been settled, because the Continental Lines, Ltd., stated that they had acted with the authority of the defendants.

The Common Serjeant, in giving his decision, said he was perfectly satisfied that the defendants had ratified the charter party, in respect of which the demurrage accrued. He gave judgment for the plaintiffs for the full amount claimed, with costs, and made an order that interest should be allowed from the date of the writ, June 20.

An application for a stay of execution was refused.

Builder's Action for Balance of Payment.

In the Official Referee's Court of the High Courts of Justice recently, Mr. E. W. Hansell, K.C., one of the Referees, concluded the hearing of the action brought by Mr. Thomas George Morris (trading as Morris & Co.), builder and contractor, of Smith-street, Sloane-square, S.W., to recover from Mr. Samuel Rubinstein, of 70, Teignmouth-road, N.W., a sum of £130 11s. 10d., being the balance of work done and materials supplied as a builder. Defendant denied liability.

Mr. J. P. Eddy appeared for the plaintiff, and Mr. S. Lincoln for the defendant.

The Official Referee gave judgment for the plaintiff for a sum of £125 11s. 10d

LONDON ASSOCIATION BUILDERS' FOREMEN A CLERKS OF WORKS

THE annual dinner of this associatio held on Saturday last at the Hotel W.C. In the absence through illness John Jarvis, Bt. (Chairman of J. Jar Sons, Ltd.) the chair was occupied b Charles E. Jarvis. There was an atten of nearly 400, among those present Major Rice, Mr. C. H. Quelch, Mr. Talbot, Mr. F. C. Failes, Mr. Howard, Mr. A. F. Jones, Mr. C. S. Mr. H. Roberts, Mr. C. F. Hickman A. D. Edmunds, and Mr. J. A. Louden don Association of Builders' Foremen) Tett (President of Incorporated Assoc of Clerks of Works), Mr. J. Bousey dent of the Provident Association of Bui Foremen and Clerks of Works), Mr. Sabey, Mr. E. Wisher, Mr. Ben Carter G. H. White, secretary, etc.

Following the usual loyal toasts, the man, in giving "The London Associati Builders' Foremen and Clerks of W after making sympathetic reference t illness of Sir John Jarvis, who was pro ing favourably, said that the Associatio in need of funds, and it looked to gathering to augment them considera enable the committee to carry on their work. The Association was formed ir by a few enthusiasts, who banded them together for protection and a desire to the status of all who had risen to the tion of general foreman. The Asso was, at that time, known as the Bu Foremen's Association, but in the cou a few years its membership had consid increased, and, as many of its membe become clerks of works, a change o became necessary. The present title b operative in 1924. Benefits of memb of the Association were many and principal among them being an une ment benefit, death benefit, assistan obtaining employment when disengaged through the medium of the secretary a advertisements, and by a pension fun was to augment the latter fund that had met together that evening. The was formed in 1904, and since that tim proved of the greatest value to many members and widows of members. moment there were six members and widows enjoying the pension at an cost of £520. Although the fund wa tributed to by a proportion of the me subscriptions, much depended upo amount subscribed to the chairman at that annual dinner, and he asked present to make this year's collect record one. The chairman then r message which he had received fro John Jarvis, who stated that his date totalled nearly £190. In order courage everyone to be as generc possible, he was able to say that all tions up to a total of 25 guineas wo doubled.

Mr. H. Rose, the President, brie sponded to the toast, and in so doi pressed on behalf of the Association sincere thanks to Mr. Jarvis for so taking the chair at such short notice.

Mr. E. Wheeler, Vice-President, ga toast of "The Architects, Surveyors, B and other Visitors," which was respon by Mr. J. Mitchell, Secretary of the ciation of Architects' and Surveyors' nical Assistants, who remarked that tects and builders were not unmindful services which were rendered to the b industry by the members of that Asso

The toast of "The Chairman" was h accorded on the proposition of Mr. W. who as one of the founders of the A tion (after thanking Mr. Jarvis for ing) asked him to accept on behalf John an emblem of life membership Association which that gentleman h pressed his willingness to accept.

RMING OF CHURCHES, BLIC BUILDINGS, ETC.

have received the following further ondence on this subject:—

—I have read with considerable in- the letters that appeared in your issue ober 28, with reference to the warming urches, public buildings, etc., and it certainly appear to me that the two answering Mr. Whitmore Robinson's from conclusive.

dealing with the first letter it would ly appear that the subscriber to the in instancing two cases of unsatis- y warming by hot water, has omitted sider the question of whether the appara- installed was satisfactorily designed— lso whether the stoking of the appara- ad received the attention that was ary, and, generally, instead of making nite statement with regard to the suita- of vacuum steam for various work, f asks various questions. I am in- to think that we to-day are rather too look to America for our systems of g than to consider our own climatic ions and the systems suitable.

second letter from A. W. B. appears to en more rambling than the first. I see how this correspondent could ly think that Mr. Robinson had con- heating by exhaust steam with heating t water by means of a calorifier, and I support Mr. Robinson in his statement thirty years ago the buildings were heated by exhaust steam.

question of the thermostatic steam ardly affects the question, as whilst it portant, it is certainly not a necessity. ng by exhaust steam, I venture ggest, is not suitable, but there doubt that there are thousands uildings throughout the country are heated to-day with either st steam direct or by means of calori- fed with exhaust steam.

THERM.

reply to the above letter our con- tors write as follows:—

,—In answer to the letter of your spondent, "Therm," who asks for de- statements; I am able to state that wo unsatisfactory heating installations, ioned in my earlier letter, were planned ngineers of repute, and the work was ed out by first-class firms. There is an neer, a clerk of works, and a works de- nent at the cathedral, and the boilers well looked after. An intelligent man charge of the boiler in the church; the ing and flue cleaning are properly ed out.

hold the opinion that low pressure steam ry suitable for the warming of extensive lings in which there are very long runs ains and branches, and in such cases nstallation of a vacuum pump may be a nct advantage. In the case of high lings, there is less pressure on the boiler the mains than is the case when hot r is the circulating medium. With steam, ressure of from 2 to 5 lb. per n. is sufficient in nearly all instances. th regard to looking to America: a wise on looks out for the best ideas, and ts them wherever they can be used with ntage; he is little concerned about the of their origin.

A HEATING ENGINEER.

R,—The letter of your correspondent herm" certainly suggests that he has not my article carefully; he misses the t entirely. Nothing in my article sug- s that buildings were not warmed by ust steam thirty years ago, nor did I that the method was something new; statement I made was that it had not ved the attention it merits; in other ds, it is a branch of the heating indus- which might give the heating engineer and contractor more business if they gave it more attention.

Your correspondent states that "heating by exhaust steam is not generally suitable," he next asserts that there are *thousands* of such installations in operation. It is not usual to install unsatisfactory systems by thousands. I can only repeat that mention of a dozen such installations in actual operation would be a far more convincing statement. Nothing in the article suggested that exhaust steam is suitable for all phases of heating; it has its limitations, but there are numerous buildings in which it could be used as a heating agent, with advantage to all concerned; that is the point.

A. W. B.

INDUSTRIAL CO-OPERATION

IN his presidential address to the Institute of Fuel on November 23, Sir Alfred Mond, although mainly concerned with the condition of the coal industry, touched upon many matters of general interest. Referring to the great need for co-ordinated research work in this country, he said that if comparison was made between the work done in Germany by the research bodies which were set up before the war and have been continuing ever since, with any effort made in this country, it made us absolutely ashamed. In Germany they had a magnificent centrally equipped institution to deal with all the fuel problems of all the various collieries, and all fuel and heat problems that come up, staffed by extraordinarily capable people, with a very big number of able men under them.

Research was a gamble. One could not tell beforehand whether it was going to be a good proposition or not, but the German idea was that there were certain lines of work which looked promising, and they went into them in the hope that something would result in ten years' time. Compare that kind of vision with one where one found a few people quite inadequately equipped, asked every few months if something had not happened yet, and probably dismissed at the end of a year because there was no profit to show. He said deliberately, because he thought it was very vital, that the industries of this country, unless they were going to tackle these problems on the scale and with the seriousness they really had not yet realised, would find themselves in time displaced in the industries of the world, and rightly displaced, simply by higher technical efficiency and better scientific work.

One could not stop the march of progress and science and ideas, and either we spent our time buying other people's ideas or we went out of business. There was no reason why we should do either. He was convinced from what he had seen himself and what he knew from years of practice, we had plenty of able scientific men and practical technical men in this country, and it was up to those who were leading industry to take every possible advantage of them on an ever-growing and more continuous scale. To crown the edifice of British industrial reconstruction what was required was industrial co-operation. He was a believer in the equality of the whole industrial trinity. There was no time and no occasion to have industrial disputes or industrial disturbances.

What we wanted to do was to remove from our industrial vocabulary such words as industrial war or industrial disputes, whether caused by strikes or lock-outs. There had been a great move towards industrial co-operation during the last few months. The leaders on both sides realised that industry could not prosper without industrial co-operation. The ideal to be aimed at, therefore, was complete industrial co-operation, each side frankly recognising the problems which faced them, and stepping forward with an equal and firm determination to let no obstacle stand in the way of a real and permanent understanding in all directions.

RENT RESTRICTION: DECONTROL

A CASE illustrating the uncertainty existing as to the interpretation to be placed upon the first part of section 2, subsection (1) of the Rent Act, 1923, which gives decontrol in certain cases, is Brooks and Others *v.* Liffen (*Weekly Notes*, November 26). The case is at present only shortly reported, but it appears that in 1904 the defendant had become lessee of a dwelling-house under an assignment of a lease for 98 years, of which at that date 20 years remained unexpired. The term thus expired in 1924, and the defendant was in occupation of the house under this lease when the Rent Act, 1923, came into force July 31, 1923. The net rateable value of the house was £38, and the rent reserved under the lease was £5 a year. By correspondence between the plaintiff in this action (the owners of the house subject to the duration of the above lease) and the defendant, it had been arranged that on the expiration of the lease in June, 1924, the defendant should retain possession of the premises as a quarterly tenant at a rent of £56 a year, and the defendant so remained in possession. In November, 1926, the plaintiffs had served on the defendant a notice to quit on March 25, 1927, and on the defendant refusing to quit, this action was brought to recover possession. The defendant claimed that he was protected by the Rent Acts. For the plaintiffs it was contended that as under section 12, subsection (7) of the Act of 1920, "where the rent payable in respect of any tenancy of a dwelling-house is less than two-thirds of the rateable value thereof this Act shall not apply to that rent or tenancy and this Act shall apply in respect of such dwelling-house as if no such tenancy existed or ever had existed," the defendant must be deemed the "landlord" of the premises under the first part of section 2, subsection (1) of the Act of 1923, and as he was in possession of the whole house when the Act came into force July 31, 1923, the house had become decontrolled, and the case Finey *v.* Gougoltz (1926, 2 K.B. 322; *The Builder*, June 11, 1926) was relied on.

The Divisional Court affirmed the judgment delivered in the County Court that the house was not decontrolled. The following passage seems sufficient to dispose of the case; "The object of section 2, subsection (1) of the Act of 1923 was to confer certain rights on a landlord at the time when the question of his position as against the tenant arose. A tenant might be deemed to be a landlord if he sublet, but it did not follow that if he did not sublet he was to be deemed to be a landlord in relation to the freeholder who was in fact his landlord."

In Finey *v.* Gougoltz, the holder of a lease for 99 years, expiring in 1940, at an annual rent of £10 per annum, the standard rent of the house being £60, and who had in February, 1925, then being in possession of the whole house, sublet an unfurnished room in the house, was held to be the "landlord" of the house in possession of the whole house at the passing of the Act of 1923, and the room sublet was decontrolled.

We showed in a recent article in these pages (October 29) the great difficulty of reconciling the decisions on this difficult section, and especially under the proviso to it, which speaks of parts of houses being sublet, where there are three parties, the landlord proper, or owner, his tenant, called the mesne tenant, and a subtenant of the latter, the difficulty being to determine when the first of the above can be eliminated and the tenant treated as landlord, but in no case until that we have just been considering has it been contended that a lessee can occupy a dual position as regards his own landlord, the owner, and the possession by the lessee or tenant be relied upon by the owner as giving decontrol.

—.—**Sierra Leone.**—Quantity Surveyor required the Public Works Department for two tours of to 18 months' service with possible extension. ly at once, Crown Agents for the Colonies, 4, bank, Westminster, S.W.1, quoting M/277.

DECAY IN TIMBER

In the course of a letter on this subject the *Times*, Mr. W. D. Caröe, speaking of death-watch beetle, says he is of the nion that "the term 'beetle' should in- de its grub, which is the chief offender. is pernicious insect is too much with us present. Much, too often ignoring essen- ls, has been said and written about it. It s become a kind of scare, often, but not ays, justified by the facts.

'It is patent that if the insect had been active in and since mediæval days as to- y hardly a mediæval timber roof would ve been left to us. Why this latter-day ivity? There must be some essential dif- ence between mediæval and modern condi- ns. My last interview with Professor froy (who gave his life in the investiga- n) took place shortly before his pathetic ath. The chief point we discussed was insect's food. A point frequently over- ked is that the insect's favourite food is mp wood. Damp wood in roofs is chiefly e to sap wood (the outer rings of wood un- ened in the tree when felled). The care- s, often criminal, use of sap wood is one the banes of building. Sap wood, like otting-paper, absorbs moisture from the nosphere, so we find that the beetle inevit- ly attacks sap wood wherever to be found t may leave all else intact. Plenty of diæval beams with indentations or eroded rts, or beams looking like rough logs of es, were all once squared but have had e sap wood eaten off by the beetle, which s left the sound wood intact and gone ay. Roof or gutter leakages, timbers built o walls damp from any cause, timbers sub- t to constant changes of temperature and ndensation, timbers unventilated, are all the tural prey of the insect.

"Our modern demands for heating are a rtile cause. Warm air charged with mois- re in suspension rises to the roof, exposed the outer air on its upper side, and is pidly chilled, leaving its moisture con- nsed on the cold timbers. There the insect ds its lair. Vaulted buildings with an ter weather roof are thus comparatively mune, but can of course equally suffer m leakages and lack of ventilation, and er such introductions of damp. Whether ht, or the lack of it, is an element is not. think, yet proven. Tree trunks damaged lightning or gale and kept wet by drips m above may often be seen riddled by the etle, though in full sun. On the other nd, the sap wood of a dead trunk, though ered by the bark, will be found equally dled when the heart still remains sound. e conclusion is, eliminate sap wood, venti- e your timbers, and keep your roofs atherproof, and the beetle's attacks are ured against. It often happens in old fs that the beetle has left its trail many rs ago and gone away. The condition in t case is not one of alarm. Its active sence should always be established."

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Acton.—Acton Chamber of Commerce is asking L.M.S. Rly., to construct a station or halt in Western-av

Wrexham.—Governors of Technical Institute considering scheme for new building for institute. Work is estimated to cost £16,000.

Industrial and Public Lighting.

A very successful and interesting meeting of the technical committees of the International Commission on Illumination was held at Bellagio at the beginning of September About 70 delegates from 10 countries attended. The meeting was arranged as a precursor of the plenary session of the Commission which is due to be held in America next year. The technical committees had a very full programme in discussing the rather numerous papers on their various subjects of study. Industrial lighting from the point of view of glare received considerable attention, and the British Specification for an Industrial Reflector Fitting, in which very successful efforts were made to eliminate glare, received favourable comment. The Commission is now committed to an intensive study of such new subjects as signal glasses, daylight illumination, street lighting, fundamental research on glare, etc. The secretarial work involved is now allotted to the various national committees, who each take responsibility for one or two subjects. Mr. C. C. Paterson (Great Britain) was elected president of the Commission in succession to Dr. E. P. Hyde (U.S.A.). The report on the meeting may be obtained, price 2s., from the National Physical Laboratory, Teddington.

NEW COMPANIES

THE particulars quoted below have compiled by Messrs. Jordan & Sons, Company Registration Agents, of 116 & Chancery-lane, W.C.2, from the docum available at the Companies' Registry.

SAMUEL SEAL & SONS, LTD. (224, Registered September 10. Quarry ow stone merchants, etc. Nominal ca £7,000.

TRADE NEWS

An Old-established Building Firm.

There have come to our notice some particulars regarding an old-established firm of builders in Oxford—established in 1797 and still running under the name of "Knowles & Son." This business was probably started in Oxford some time previous to 1797, as there is still an existing ledger of that date, and no doubt there must have been some form of day-book used before then. Also the firm had a contract about that date for building a bridge over the Thames, and for which they were allowed the big sum of £10 owing to having had bad weather and floods during their job. The firm also has a charter from the University of Oxford stating that the great-great-grandfather of Mr. H. R. E. Knowles — a director of the firm — was a matriculated tradesman of the university, and that he had to swear allegiance as such to the university only and not to take any notice of the civic authorities.

A Staff Dinner.

The annual dinner of Messrs. Rhodes' Chains, Ltd., took place at the Florence Restaurant on Friday, December 2 last, when the clerical staff of their head office and branches were entertained by the directors. The managing director, Mr. B. D. Hughes, took the chair. At the conclusion of the dinner, loyal toasts were proposed, and a toast to the chairman and directors was proposed by the sales manager, Mr. H. H. Millett. The company then adjourned and spent the remainder of a very pleasant evening at the Palace Theatre.

Single-Action Door Springs.

We learn that the "R.A.V." door-closer—placed on the market by Robert Adams, of 3-5, Emerald-street, Theobald's-road, W.C.1—is of the so-called "liquid" type, in which a non-freezing liquid, acted upon by a piston moving within a metallic cylinder, checks the powerful movement of a heavy coiled spring. We further gather that simple adjustments, readily made by anyone, so bring these opposing elements into conjunction that the speed of closing the door may be regulated to suit any condition. The closer is made in four sizes of varying strength. Full particulars and prices may be obtained from the makers.

Steel-Faced Flags.

We have received from the makers, the Langley London, Ltd., details and a descriptive booklet of their steel clad concrete flags. These "Stelcon" flags are, we learn, excellent for factory floors, as they withstand exceptionally heavy wear and tear. For terraces, loggias, forecourts, paved courtyards, garages, etc., "Stelcon" Porphyry flags, obtainable in various colours, are very suitable. Details will be sent upon request.

Lifts and Hoists.

Messrs. Wm. Wadsworth & Sons, Ltd., the makers of lifts, transporters, cranes, etc., of Bolton, have recently opened an office at Canada House, Baldwin-street, Bristol, for the purpose of giving closer attention to lift and hoist business in the south-west of England. The manager at this office is Mr. E. Grayson Holt, who has had several years' experience in lift and hoist work, and is a qualified engineer.

Night and Day Water Heater.

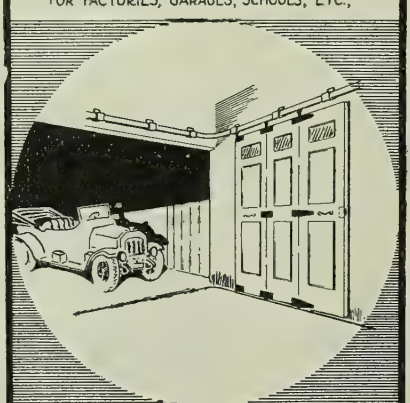
We have received details of a water-heater and boiler, placed on the market by Mr. E. Horace Thompson, High Pine Close Estate Offices, Weybridge, and named the "Nocondense." In this system the hot water is obtained by the simple device of fixing five small jets under a water tank. Normally this results in rapid external condensation on the bottom of the tank, thereby retarding the heating and causing great nuisance by flooding around the tank. We gather that the "Nocondense" is so constructed as to prevent this condensation. The small heater, we are told, consumes only 60 cub. ft. of gas per 24 hours, and for this will supply two hot baths and sufficient hot water for domestic purposes in addition. Full particulars of this apparatus will be sent upon application to the maker.

New Dyeworks at Leek.

The first section of a new dyeworks is now in course of erection at Leekbrook, near Leek, for Messrs. Joshua Wardle, Ltd. The estimate of Messrs. J. Gerrard & Sons, Ltd., Swinton, Manchester, has been accepted, and amounts approximately to £162,000. The associated architects are Messrs. E. Howard & Partners, 58, Pall Mall, London, and Messrs. Longden & Venables, F. and L.R.I.B.A., St. Edward-street, Leek, also of Hanley and Macclesfield.

A Cement Dividend.

The first annual general meeting of the British Cement Products and Finance Co., Ltd., 5, Lothbury, E.C. 2, was held on Tuesday at Winchester House, E.C. 2. Net profits for the year were £124,753 2s. 8d., and the directors recommended a dividend of 15 per cent., less tax, on the ordinary shares, plus a bonus of 1s. per share, also less tax. The deferred shares carry a dividend of 95 per cent. and a bonus of 11.4d. per share, both less tax. Mr. A. J. Chapman has been re-appointed managing director.



Force-Feed Lubricators.

Force-feed lubrication is recognised as an essential in nearly all kinds of engines, stationary, portable and marine, and also in many classes of machinery. It is essential to have proper means of regulating the supply to each bearing surface to ensure ample lubrication without excessive oil consumption, and the Messrs. Petters', Ltd., "Calibrater" represents the results of many years of experience in the design, construction and operation of power units and mechanical lubricators of many types. It is, we learn, positive in action, and its mechanism—although containing many special design features—is of a straightforward nature operating on good mechanical principles, and is subject to practically no wear, since all the working parts run submerged in oil. Messrs. Petters, who are of Yeovil, issue details also of their 7/9 k.w. petrol-electric generating plant, an excellent plant for manufacturers, contractors, cinemas, etc., and for emergency and stand-by service. Details of this and of the lubricator will gladly be sent upon application.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

XIII. No. 4428 DECEMBER 16, 1927.

WATERLOO AND CHARING CROSS BRIDGES

HAT the question of the demolition or retention of Waterloo Bridge specially concerns architects as well as engineers has been tacitly, if not vocally, acknowledged even by engineers themselves in the protracted discussion on the fate of the bridge. it is almost entirely due to the active interest which ts, supported by the Press and public opinion, took roposals of the London County Council that the bridge sts, though if certain apparently inspired newspaper ohs can be relied on, its fate is now virtually decided L.C.C. will shortly announce their decision to demolish ratory to constructing a new bridge. Such an intention e of very great importance, especially if the further nt can be relied on that "the decision hinges on the of an expert committee which has been examining mmendation by Lord Lee's Commission of the erection uble-deck road and railway bridge at Charing Cross." erts, we are told, are satisfied that from an engineering view the proposal is impracticable, apart from which t would be prohibitive. Assuming the accuracy of ecast, the decision, so far as it affects the proposal for e-deck bridge at Charing Cross, will probably be wel- by most people who have seen some of the schemes ave been proposed, bearing in mind that the broad fore us is the improvement of London in an æsthetic as a practical sense.

f such a decision has been made, the occasion seems ne to ask whether it is altogether desirable that such s, with their far-reaching consequences, should depend on engineering experts, and why the very reasonable on of the Royal Institute of British Architects made to istry of Transport should not be agreed to, that as tural problems are involved in the investigations of stion of a new Charing Cross Bridge, an architect should d to the Committee of Engineers. We publish on another ie correspondence between the Ministry of Transport e R.I.B.A., and while we note that on August 23 the e was informed that the engineers had been appointed purpose of investigating the practicability, alignment t of the suggested bridge and that "it is not considered y architectural problems are likely to arise at this stage," k the reply of the Institute of November 4 is unanswerable. me Minister stated in March, 1926, that the Govern- would be "prepared to contribute to the scheme if, xamination of its engineering, financial and æsthetic it appears satisfactory," and the Institute very properly nt that "Unless this means that an architectural inquiry low the engineering one, which can hardly be the case, l appear to be essential for the architectural standpoint epresented on the present committee of inquiry, and ly so because the leading architectural considerations question of the level of the bridge in relation to the the alignment of it as affecting the matter of sites for nt buildings, and, most important of all, the question her the bridge should carry both roadway and railway railway be taken under the river at some convenient They further point out that "The design of the tself as an architectural composition is, of course, very nt, but these other considerations and possibly many e fundamental, and should certainly not be dealt with neers alone."

yone who has given the question of a new bridge at Cross serious study and consideration, and who has, therefore, attempted to envisage the problem in the various ways it could be solved, knows that these architectural considerations go to the root of the matter, and even if they have received adequate or any attention at all from the committee of engineers, which we very much doubt, it is essential, if public opinion is to be satisfied that the right decisions are being made in a problem that is really of national importance, that the fullest and most sympathetic consideration should be given to the views of architects; as, of course, they would be in similar circumstances in other countries, where we find architectural opinion and help solicited and not flouted. It is really extraordinary that the official mind in this country should be apparently so hostile or at least indifferent to æsthetic considerations and the ideas of artists, and we can only conclude that in this bridge question the point of view is not understood by the Ministry of Transport. Architects know full well that the Charing Cross Bridge problem is one requiring the best engineering skill and knowledge, and they know this skill is available, but they believe the problem is one requiring architectural skill as well if we are to be saved from the repetition of past blunders, or if we are to hope for the realisation of a scheme of imagination and vision.

To say, as the Ministry of Transport do, that architectural opinion is not needed at this juncture is entirely wrong, for it is on the sound initial grasp of the subject that architectural advice would be so helpful and would do so much for the improvement of London, which is what we should all desire.

The Royal Institute of British Architects, in the correspondence with the Ministry we quote, give some good reasons why in their judgment an architect should be added to the Committee of Engineers, and without committing ourselves to the soundness or otherwise of these reasons, we strongly urge that the time has come for all aspects of the question to be considered by the Committee, strengthened by an architectural representative. The fate of Waterloo Bridge should not depend on the investigations of the present Committee as to a double-deck bridge at Charing Cross until what seem to be feasible or even desirable alternative schemes—two of which we illustrate this week—have been considered. We are told the Ministry of Transport recognise the importance of the architectural considerations which must arise, but that they do not consider that any useful purpose would be served until the "general features" of the double-deck scheme, "which must depend on engineering and financial considerations, have been investigated." There is a responsible and increasing body of opinion that this is the wrong starting point and that there are other lines of investigation besides that of a high level bridge. The architectural aspects of the problem should be dealt with on broad lines at the outset and before any irrevocable decisions are made. Will the Committee, for instance, consider the question of an underground railway and station and the provision of a new bridge for vehicular and pedestrian traffic? In view of the terms of reference, we presume they will not, but before we are committed to another railway bridge at Charing Cross, the question of the ultimate development of the railways of London should be fully considered—whether or not, from a standpoint of comfort, convenience and æsthetics, such development should be on the lines of a completely linked-up system of underground traffic. These and other related considerations are, in our opinion, matters which especially concern the architectural profession, and we hope the representations of the Royal Institute of British Architects will not be made in vain.

NOTES

Imagination and City Improvement.

IMAGINATION is one of the most valuable qualities in life. Often misleading and even dangerous, it may be of the highest value. Obviously, to those concerned in the development of towns and cities, the power to imagine a transformation from the commonplaces of economics and merely practical affairs to a higher level of dignity and grandeur, is an asset of the highest importance. Imagination enables us to visualise some ideal qualities and to forecast what is likely to be the outcome of present conditions and events. As a town or city develops we cannot properly guide that development unless we can imagine something of what the future holds. In the efforts we now make for the betterment of London we have many things to take into account before we can direct our efforts to the best results for the future. That is why there has been brought forward the question of railways in London, for on their development so much great improvement or great and permanent drawbacks may lie. The problem of what is best to do for a bridge at Charing Cross illustrates this difficulty in an acute form. We are actually being asked to consider a design for a double-deck bridge at Charing Cross before we have been called upon to face the question as to whether we shall permit an above-ground station at Charing Cross or insist on the railway coming underground. This is putting the cart before the horse with a vengeance. If we determine to have railway lines crossing the Thames above ground, we must make up our minds to a very real loss to the general amenity of London. But at least the issue ought to be faced, for unless we take things in their proper sequence we shall only continue the inarticulate muddle which has gone on for years and deprived London of many splendid chances for improvement. There are thousands who love London. Are there not enough to be found who can agitate to some purpose for a wiser and more imaginative view of its future ?

The Problem of Charing Cross Bridge.

WE have illustrated several designs for high level bridge schemes for Charing Cross, and the two low level schemes we publish to-day claim to show that it is better for the general amenity, as well as for ultimately better practical value, to adopt a low level treatment. We have certainly seen much able and ingenious planning for this important subject, and we sincerely hope that whatever is finally adopted may be for the real advantage of London from every point of view. The advantage or distinction of any particular individual is of comparatively no account. We can only hope that the problem may be dealt with in such a way that no important aspect of it is denied proper consideration —our only object is to assist, so far as we can, towards a right solution.

The Danger of a Charing Cross Bridge.

PROBABLY no criticism on the problem of the Charing Cross Bridge has been so pertinent and illuminating as that given recently in a letter to the *Times* signed Donald A. Matheson (formerly general manager and consulting engineer of the Caledonian Railway and general manager in Scotland of the London, Midland and Scottish Railway). It certainly deserves respectful consideration. He suggests that to remov ing Cross station about a hundre at a cost of perhaps millions, w inexpedient and absurd. Also t double-deck structure all the wa the Strand at Charing Cross to th side of the river would be most tionable, and such a structure w a monstrous thing. It would re the civil engineering skill of the as well as on the imagination a foresight of those accustomed t the problems of traffic."

Value of Imagination.

Now in the above r we find the strongest p emphasis on our o sistence on the va imagination in town development.

Practicability and Forethought.

BUT not only doe Matheson say this of ir tion, but he says from æsthetic consider the great objection double deck bridge with its hig thoroughfare would be its want fulness. It would be too much air, and the last state would re worse than the first. And final Matheson claims, as we have s done, that the bridge problem ca properly solved until the questio site of a railway station in subst for Charing Cross station is settle

The Manchester Reference Library.

WE are glad to not the report, printed on a page, of the recent of the Manchester of Architects, that th Mayor of Manchester has laid c guarantee, over his name, that w may happen to the proposed ex of the Town Hall, the Reference —which, with the Town Hall exte

the subject of the recent com- won by Mr. E. Vincent Harris— ndeed be built. This statement sting, following as it does upon rs expressed in our leading article mber 18. It cannot too strongly hasised that the winning of a n is not the primary objective of tect when entering a competition ; re is no doubt that should the ster Reference Library building n hand, it would, in some measure, a further reassurance, as far as ster is concerned, in the eyes of rchitects who contemplate taking the recently announced com- for the College of Technology ons.

eful n- ive ring.

We commend to the attention of our readers the excellent speech made by Mr. A. H. Adamson, president, at the annual dinner of the Master Builders' Association ed on page 950 of this issue), in the of which he strongly criticised esent "wasteful system of com- tendering," and urged that a able conference of architects, rs, surveyors, and operatives should nged, "with a view to discovering of bringing down the cost of g so as to absorb the labour that hortly be released from housing." oblems are of more serious import building industry than that of itive tendering. By many it is d as an inevitable accompaniment ompetitive system, but others who alified to judge hold a contrary . If it is possible to discover some of avoiding the present serious f time, money and effort in the tion of competitive estimates, conference such as that proposed by Mr. Adamson should discover it. We hope this suggestion will be followed up. A special and very pleasing feature of the dinner was the presence, for the first time, of the Secretary of the National Federation of Building Trade Operatives, Mr. J. Murrey, whom we were glad to hear profess his faith in the round-table conference as the best method of dealing with industrial problems.

Professor Lethaby's Retirement.

To none more than craftsmen has Professor Lethaby's tenure as Surveyor to the Abbey been important in the appreciation and sensitiveness he has always shown for the claims of vital craftsmanship, the absence of which is so great a loss to architecture to-day. It is, in no small degree, owing to him that craftsmanship holds with us all a greater importance at the present time. Entering on his duties at the Abbey when there had been so much ruthless destruction of traditional craftsmanship in this country, his care and wise conservancy of it in the Abbey—almost re-discovery of some of it—marks his period of office as one specially distinguished. Moreover, it has set us an example of the wisdom of repair and conservation over so-called restoration. Restoration, as a rule, restores nothing. It destroys far more than it restores, and the advantage, as in the case of the Abbey monuments, of appreciative cleaning, and repair, is to be seen in the re-appearance —quite another thing to restoration—of many of them, so that to-day we see work almost as it was originally executed. When we recall the far different methods of the Victorian period here, or the depredations of Viollet-le-Duc in France, we realise the value of Professor Lethaby's conservative example, which has been of really national service to the cause of art.

"The Sport of Kings" at University College.

Towards the close of the year, the students of some of our architectural schools devote their leisure moments to the study of dramatic art and present a play, which invariably provides agreeable entertainment. This year there is to be no A.A. Play, owing to the Bedford-square premises being in the hands of the builders; but on Monday and Tuesday evenings last, the architectural students of University College gave their annual theatrical entertainment, presenting Ian Hay's amusing comedy, "The Sport of Kings." The performance took place in the College gymnasium, and was a complete success in every respect, a large and appreciative audience being present on both occasions. We have no space in which to do justice to the talent displayed, but it may be said without exaggeration that every member of the cast played well. Mr. George Lay and Mr. Edward Steel were excellent in the "sporty young men" parts of Algernon Sprigge and Sir Reginald Toothill respectively, while Mr. Deane Anderson (who was also responsible for some first-rate scenery) acted convincingly as the hypocritical Amos Purdie. Miss Evelyn Walston was charming as Dulcie Primrose while Mr. Hal Burton and Miss Joan Richards were amusing as the refractory young Purdies. Mr. Eric Ambrose gave a real piece of character acting as Bates the butler, and minor parts were well sustained by the Misses Dorothy Norie, Joan Drury, Annie Hall, Elizabeth Loveday, and Phyllis Mitchell, and Messrs. Elidir Davies, Mortimer Montgomery, Douglas Nightingale, and Ellis Somake. The play was excellently produced under the direction of Mr. Laurence King. Mr. Arnold Schneider and Miss Hall acted as stage and business manager respectively.

Competition for Australian National War Memorial, Villers-Bretonneux, France: First Premiated Design.

Mr. William Lucas, Architect. (*See page* 928.)

GENERAL NEWS

Professional Announcements.

Mr. Henry G. Gamble, F.R.I.B.A., of Bank Street-chambers, Lincoln, has taken into partnership Mr. R. Neville Barker, A.I.A.A., and Mr. Philip W. Birkett, A.R.I.B.A. The practice will still be carried on at the same address, under the title of Scorer, Gamble & Co.

We regret to announce that Mr. John T. Skelding, practising in the style of J. T. Skelding & Co., auctioneers, valuers, estate agents, of 48, Gresham-street, Guildhall, E.C., who for some time past has been in indifferent health, is, under doctor's advice, giving up his London practice, and is ordered to take a complete rest for six months.

Royal Institute of Oil Painters.

Mr. William Hunter, Mr. Alexander Jamieson, and Mr. William T. Wood, R.W.S., have been elected members of the Royal Institute of Oil Painters.

Shakespeare Memorial.

The Worshipful Company of Clothworkers have made a donation of £250 towards the rebuilding and endowment of the Shakespeare Memorial Theatre at Stratford-on-Avon.

Marlow Bridge Scheme.

Plans have been prepared, we learn, for the construction of a reinforced concrete bridge across the Thames at Marlow to replace the existing iron suspension bridge. The new bridge will have a single span and will cost £70,000.

Royal Society of British Sculptors.

Lord Lee of Fareham and Mr. Walter Tapper, P.R.I.B.A., have been elected Vice-Patrons of the Royal Society of British Sculptors at the general meeting of the Society. The following five sculptors have been elected associates of the Society :—Mr. A. C. Carter, Mrs. E. M. Gabriel, Mrs. M. R. Mitchell, Mr. G. H. Paulin, A.R.S.A., and Mr. H. Tyson Smith.

Maintenance of Parliament-square.

Westminster City Council are to consider taking over the maintenance of the south side of Parliament-square, St. Margaret-street, Old Palace-yard, and Abingdon-street. Recent changes in traffic regulations and direction in the roadways have convinced the Office of Works that it was desirable that the local authority should be the responsible authority for the control of the roads. To effect the transfer, legislation will be necessary.

New Motor-car Park for Windsor.

A public inquiry has been held at Windsor Town Hall into the town council's application to the Ministry of Health for sanction to borrow £3,680 for the purchase of land and the erection on it of public sanitary conveniences, and £9,399 for the provision of a parking place for motor-cars in the River-street area at Windsor. When the park is ready the parking places in Park-street, Thames-street, and Victoria-street will be reserved for use in emergency. A large number of dilapidated houses have already been cleared from the site of the park.

Widening of Prince's-street, E.C.2.

The Corporation of the City of London has received a letter from the London and Home Counties Traffic Advisory Committee on the question of widening Prince's-street on its western side to 60 ft., intimating that it appears to the Committee that such a widening is of very great and increasing importance; submitting for adoption a plan for widening Prince's-street to 60 ft. on the western side in front of Nos. 2 to 5 (the National Provincial Bank and the Midland Bank), at an estimated cost of £250,000, and recommending that Notices to Treat be served (if necessary) to acquire all interests in the ground required for the improvement, and that the Ministry of Transport and the London County Council be asked to contribute towards the cost.

Wall Paintings.

Regarding a letter on this subject addressed to the *Times* and commented upon in our last issue, Mr. W. M. Palin has written to our contemporary as follows :—"May I be allowed to endorse Professor Laurie's views on the use of beeswax as a varnish on the finished painting when dry? The method mentioned by him was used by me on the decorations of the McEwan Hall, Edinburgh University, 35 years ago, except that I painted thickly in oil colours on canvas and then varnished with wax. As the canvases were very large, the wax varnish, after being laid on with a brush, was 'badgered' or 'stippled,' which gave it an even mat surface all over. So far as permanence is concerned I understand the result has been successful. It is to be hoped that the very fine decorations by Mr. R. Whistler in the refreshment room of the Tate Gallery will be preserved by the same or some similar process."

Australian National War Memorial, Villers-Bretonneux.

The result of this competition was announced in our issue for August 26, and we now illustrate the winning design by Mr. William Lucas (p. 927). The structure is proposed to be generally of grey granite relieved with columns of trachyte, each material being from Australian quarries; and the estimated cost is £90,000. Standing on a circular paved piazza, some 200 ft. in diameter, with pylons emblazoned respectively with the British and French arms at ends of entrance steps, and having intermediate blocks lettered indicating the names of the six States of the Commonwealth, the memorial proper rises to a height of 100 ft. Some 12,000 names of the unknown dead are to appear on the base on trachyte, above which is a superscription in both English and French. Bronze figures representing Mercy, Truth, Righteousness, and Peace surmount cliff-like flanking masses of masonry; whilst lower and upper levels may be reached either by staircase or lift for observation purposes. The main distinctive feature is, perhaps, the open centre towards the east between Doric columns 7 ft. in diameter and 56 ft. high. The entire structure culminates in a horizontal cross, each arm of which is studded with a six-rayed star of Australian gold. The lay-out beyond the circular piazza comprises great lawns eastward and westward, whilst Australian shrubs, or dwarf trees, are indicated northward and southward.

Sir Giles Scott, R.A., was the assessor.

The Old Adelphi : Mr. A. R. Powys on the Adam Brothers.

Mr. A. R Powys gave a lecture on Monday evening at the Royal Society of Arts, under the auspices of the British Commonwealth League, on the Old Adelphi. He traced the architectural history of the century, and showed how the art of Robert Adam differed from that which was current when he re from Italy at the end of 1758. Befo brothers Adam began their practice, h the traditions of Inigo Jones and Pallad vailed. The Adam brothers, probably deliberately, developed a style which it was still founded on the examples of origin, was designed to accord wi economic facts of their day. In pl heavy ceilings, delicate modelling was in place of opulent colonnades, the brothers developed a system of ligh elegant plasters, modelled with fine derived *motifs*. The Adelphi-terrace particularly good example of this possibly because the cost of these bu was borne by the Adam brothers them It was an example of noble architecture accord with the conditions of the With regard to the future of the t Mr. Powys said that he had little hope site was extremely valuable—so valuabl the buildings standing there had little fi relation to it. Unless it was bough maintained by some millionaire who w asking for a big return, or unless the p owners of the leases formed themselve a company and purchased the proper was likely that in a few years Londoners see a great change on the river front. threat to Waterloo Bridge and the thr the Adelphi, which two places, with Sor House, formed the most beautiful sce London, was one which must make ne every Londoner who loved his City.

Worthing Parade Extension.

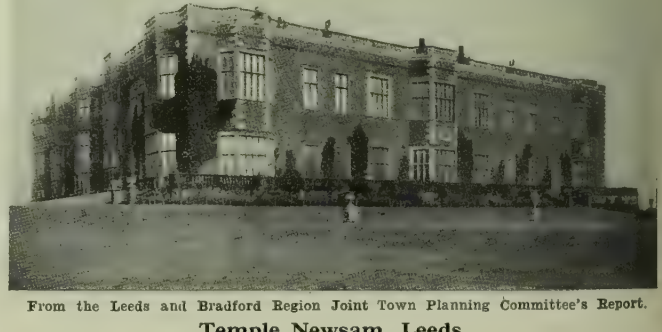
Beach House, for many years the of the Loder family at Worthing, has bought, we learn, by the Corporation Mr. H. P. Brazier, a local resident, £16,000. The acquisition of the prope about six acres in extent—will enable town council to extend the parade east from Splash Point and to widen the Brighton Road.

COMPETITION NE

Rotherham Municipal Technical College School of Art.

The assessor in this competition, Pro S. D. Adshead, F.R.I.B.A., has mad awards in this competition as follows :-

1st, Messrs. A. F. Scott & Sons, 23, T land, Norwich.



2nd, Messrs. Horth & Andrew, C House Buildings, Whitefriargate, Hull.

3rd, Messrs. Collcutt & Hamp, 126, more-street, Portman-square, London.

We illustrate the winning design this

Practical Housing Competition.

Mr. R. Kitching Ellison, A.R.I.B.A., York-buildings, Adelphi, W.C., has awarded the first prize for the house e to his designs in connection with this c tition—for houses costing not less £1,200—recently organised by the newspaper. (See page 942.)

From the Leeds and Bradford Region Joint Town Planning Committee's Report.

Temple Newsam, Leeds.

(*See page* 946.)

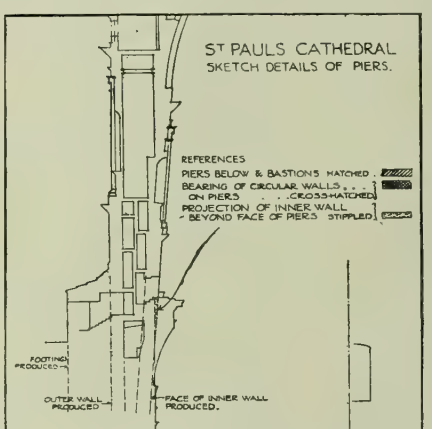
Design for a War Memorial, Stornoway.

By the late VISCOUNT LEVERHULME and MR. T. RAFFLES DAVISON.

THE PRESERVATION OF ST. PAUL'S CATHEDRAL

SIR,—I much regret to see in *The Builder* for December 9th that you have given publicity to verbal and pictorial misstatements concerning my book, "The Preservation of St. Paul's Cathedral," particularly since my former letter to you should have removed any ground for accidental misunderstanding, and the repetition and elaboration of false statements seems, therefore, to have been intentional on the part of your correspondent, who still remains "Inquisitive." I pointed out in my letter that it is stated in my book that a certain sectional diagram of St. Paul's Cathedral was taken on the line of the great pier (Figure 18, page 26), yet your correspondent has drawn a radial section through the axis of the dome and falsely describes it as "copied from" my book.

Now it is a fact of very serious structural importance that the great piers of St. Paul's Cathedral do *not* stand in lines radiating from the centre of the building, and the difference between sections taken on radial and tangential lines is considerable. That my diagram is taken tangentially to a circle about the axis, and not through the axis, is shown by the semi-hyperbola with which I have indicated Sir Christopher Wren's cone, whereas "Inquisitive" has shown straight lines on his alleged copy, taken on a radial line.



Needless to say, all the complex array of farcical diagrams and ridiculous calculations, which "Inquisitive" has erected with such mischievous diligence upon his first incorrect assumption of a radial section plane, fall flat, when this assumption is shown to be false. I believe that you, Sir, were genuinely deceived by the specious neatness of "Inquisitive's" pseudo-geometrical diagrams into thinking them sufficiently near to mathematical accuracy as to be fair comment, and that you would not willingly have lent your pages to a misstatement of this character. If I am right in this belief, you will assist me by allowing "Inquisitive's" drawings to exhibit their own inexactitude.

If you will republish his diagram (Fig. 3), which he falsely asserts "shows the actual construction of the building in the same position as Mr. Harvey's section," together with his accompanying plan (Fig. 4), you and your readers will be able to see that "Inquisitive's" geometry is far from infallible. The projection of the inner wall beyond face of piers is shown as approximately one foot in the section and two feet in the plan, though it is admitted by "Inquisitive" in his descriptive text that this dimension is 2 ft. 5 in. We recognise, after this, "Inquisitive's" right to exclaim, "No wonder Mr. Harvey declines to give any calculations or dimensions," when we see that "Inquisitive" is capable of giving three different figures for a single fact!

It will also be seen that the staircase shown on "Inquisitive's" section does not agree with his plan by something like three feet. He claims the support of the 1921-25 Commission for his statement that these staircases "form massive buttresses to the circular walls and extend as footings over the whole area of the pier and distribute their weight well back on the piers." He also says, "This bearing is shown cross-hatched on the plan," but as he has drawn two sets of cross-hatching superimposed, and the outline of neither of them agrees with his section, "Inquisitive" shows himself as futile in geometrical as in verbal criticism.

Actually, when I turn up the reports of the Commission in my book, I find that it is admitted in the final report that "The weight of the drum comprising the peristyle and that of the inner drum with its top burden act independently, as, owing to the cracks in the thirty-two radial walls between the two drums, there is practically no physical connection between them." So that even the authority "Inquisitive" calls to his aid fails him at the critical moment. When all has been said and done by "Inquisitive" to minimise or to deny the fact, it is still possible to discover, by carefully sifting his garbled evidence, that the inner drum does stands out several feet over the void, just as I said, and that its weight is applied at one corner of the pier by arches and pendentives in the form of a dangerous, concentrated, eccentric load, with a prodigious lateral thrust which tends to dislocate the masonry of the pier and to overturn the face wall of the transept.

"Inquisitive" still further falsifies his alleged copy of my sketch by omitting the part of it which shows the transept, and so

renders his drawing "fragmentary" and lacking in meaning.

Where my diagram expressed an important statical truth in general but unmistakable terms, at a time when this truth was known to me, but ignored by the Commission, who attributed lateral expansion of the building to the "cumulative effects of temperature changes," instead of to its true cause, "Inquisitive's" pseudo-geometrical drawing only shows certain details of construction, and shows them uncertainly and ambiguously. It has no important truth to tell, in spite of the years that have passed since my book was published, for the analytical survey, for which I plead so insistently, must be minutely accurate as well as comprehensive, and we have seen that "Inquisitive's" "fragmentary" diagram is anything but accurate.

I have replied in my former letter that the model illustrated on pages 114 and 115 of my book gives a clue to the value of some of my imaginary scheme of repairs. That such repairs would be difficult to execute was as well known to me as to anyone, and one purpose I had in mind was to e the custodians to look difficulties in instead of shuffling them on to generation." I implored them to the needs of the building as a whol arrange a co-ordinated scheme on hensive lines after exhaustive stu analysis. As time goes on this pa purpose comes nearer to fulfilment. *R.I.B.A. Journal* of November 26 a reference to a scheme of bracing the drums of the dome which seems the nature of a partial substitute to perform some of the function might have been exercised by my co

What will not be found in my "Inquisitive's" ludicrous geometr cated by his dotted lines purporting tinue my cone in a downward dire his figure 4. Anyone who remember cone is circular on plan will reali "Inquisitive" has misplaced his ma more in this instance.

"Inquisitive" becomes almost c when he so far forgets himself as t (apparently of critics and custodian that "they are engaged in difficu arduous work, and are entitled to support which public confidence can If he understood his own words to th he is a saner man than his geometry sents him, and though his present i of winning the support of public co in the critic hardly "advertise" "i tive," I should not wonder if they successful in the end.

WILLIAM HA

nsidering these conditions we are yet other conclusions :—

association such as the R.I.B.A. ent constituted does not intend to, ct cannot, cater for two classes of viz., practising architects and their

ere are solutions of the difficulty— roportional representation on the Council for both; another is the of the subscriptions of the assis- salaried architects to their own he amalgamation of the two bodies. difficulties in the way, but there doubt that a *via media* could be found. The present anomaly cannot continue. It is fantastic that it should be necessary for members of the R.I.B.A. to pay a second subscription to another body in order that their claims on the R.I.B.A. should be met.

The present situation reminds one of the Great War. The majority of the world was supplying munitions of war to the enemy, and the end of the war was not definitely in sight until supplies were cut off. Of course the assistant architects and the R.I.B.A. are not at war; their relations are most cordial. They have used the language of diplomacy for three years without result, and it is time to tell the brutal truth—to shout it, if necessary—to let the world know that the R.I.B.A. exists on the sufferance of the majority, who might at any time, logically and with justice, cut off supplies and organise themselves into the more powerful body.

ROBERT G. CURLING, L.R.I.B.A.

Fungoid Growth on Linoleum.

We take the following letter from a recent issue of the *R.I.B.A. Journal* :—

SIR,—I have been asked by the Science Standing Committee to draw attention to the growth of fungus—if it be fungus—not infrequently found under linoleum on floors. We are all aware that the absence of ventilation of boarded floors due to impervious coverings produces conditions favouring dry rot, but the growth to which I allude is not Merulius though its white branching fibres suggest such an outbreak. The defect occurs not only on wood floors, but on cement, hence it would seem that it is the product of the linoleum itself or the paste used in laying it, probably the latter, as the occurrence is frequently at joints. The production of water seems to be a characteristic, the floor and linoleum when taken up showing distinct marks suggesting the effects of washing when water has run under the covering. The Science Committee has approached the Natural History Museum, and it is understood that the Mycological department of the Museum, which has so frequently helped architects in the past, is willing to make an investigation provided specimens with as much data as possible are forthcoming.

I hope readers will respond to this attempt to find the solution by sending specimens to the Hon. Secretary of the Science Museum, South Kensington, S.W.7.

CHARING CROSS BRIDGE DESIGNS

WE illustrate this week two designs for low-level bridges at Charing Cross.

(1) By D. Barclay Niven, F.R.I.B.A.

It is claimed for this scheme that it is a thoroughly practicable one and, bearing in mind the large recoupment values which would accrue from it, a most economical one. Once concede the point that overhead railways across the Thames are doomed to go, sooner or later, such a scheme as this seems almost inevitable. It is important to note that the clear opening under the centre arch of this bridge is higher than that of Waterloo Bridge, and that the gradients up to the bridge and beyond are only 1 in 50. This is accomplished by raising the level of the embankment at Charing Cross some 12 ft., from which level a gradient of 1 in 50 leads down to Northumberland-avenue and up to the new bridge centre. The sloping roadway of the embankment thus created would reach the present level at Cleopatra's Needle. The entrance way at the Hotel Metropole or the National Liberal Club would remain unaltered. The approach to Waterloo Station and a new station which might be built alongside it from the bridge is only 1 in 50, and the descent from the new bridge goes under this in a similar slope. The roadway from Waterloo Bridge meets the new bridge road at a radial point where the road ascends to the station level. It is claimed for this design that the recoupment values on sites along the new street leading up to the Strand and on all the property stretching from Northumberland-avenue to the Hotel Cecil would be very great. It has been thought that this great new bridge, with the fine *place* to be created at Charing Cross and the direct approach afforded to the north from the Great Southern Railway stations would make it the subject for a fine War Memorial, to be styled the Imperial Way.

(2) W. D. Caröe, M.A.

This design is in some respects similar to the other one we publish, but in this case the tramways are provided with a sloping way under the approach to the new bridge, so that the tramway service would not be interrupted or interfere with the crossway traffic at Charing Cross. In the design by Mr. Niven the tramways are supposed to go over the new bridge.

In both designs it is clear that the authors hoped to add something to the dignity of the city and to preserve the unique value of the riverside gardens.

PRESERVING RURAL COTTAGES

MR. CHAMBERLAIN, the Minister of Health, has received a deputation organised by the Council for the Preservation of Rural England, which was introduced by Mr. Percy Hurd, M.P., and included Mr. Guy Dawber and Professor Adshead, of the Royal Institute of British Architects; Professor Abercrombie, of the Town Planning Institute; Mr. E. J. Brown, of the Institute of Builders; and Mr. H. G. Griffin.

Mr. Guy Dawber and Professor Abercrombie, speaking on behalf of the deputation, said that the Council welcomed the opportunity afforded by the Housing (Rural Workers) Act, 1926, of renovating old houses so as to provide a modern standard of accommodation without destroying the unique architectural beauties of British villages. They had prepared a scheme for the establishment of voluntary advisory panels, composed of professional men with a lay element, to advise local authorities and owners on the best manner of achieving this object. The fact that these panels would be voluntary was an entirely new departure on the part of the architectural profession, and the response had been remarkable.

Mr. Chamberlain cordially welcomed the proposals which had been put before him, which seemed to him to meet the case very fully and admirably. The voluntary character of the scheme was an essential feature. He would do his best to persuade local authorities to accept the help offered to them. While he could not give them a direction, he would express to them his personal approval of the scheme, and his hope that full advantage would be taken of it.

MEETINGS

FRIDAY, *December* 16.

London Society. Sir Frank Baines on "King Henry VIII's Hall at Hampton Court." 5 p.m.

MONDAY, *December* 19.

Royal Institute of British Architects. Dr. R. Miller, in conjunction with Mr. J. E. Franck, on "Some Medical Aspects of Damp in Dwellings." 8 p.m.

Surveyors' Institution. Major C. Thomson on "Central City Valuations." At Liverpool.

Institution of Structural Engineers. Mr. H. W. Coultas on "Experimental Structural Engineering." At Chamber of Commerce, Birmingham. 7 p.m.

TUESDAY, *December* 20.

Institute of Arbitrators Incorporated. Luncheon at the Criterion Restaurant and discussion on "Arbitration Methods in America."

WEDNESDAY, *December* 21.

St. Paul's Ecclesiological Society. Mr. W. W. Begley on "London Churches of a Century Ago." 9, Conduit-street, W. 1. 8 p.m.

Charing Cross Bridge Schemes.

Apropos of the rumoured abandonment of the proposal to build a double-deck bridge at Charing Cross, we illustrate this week two low-level schemes, by Mr. D. B. Niven and Mr. W. D. Caröe respectively. Some notes on these schemes are given on page 931.

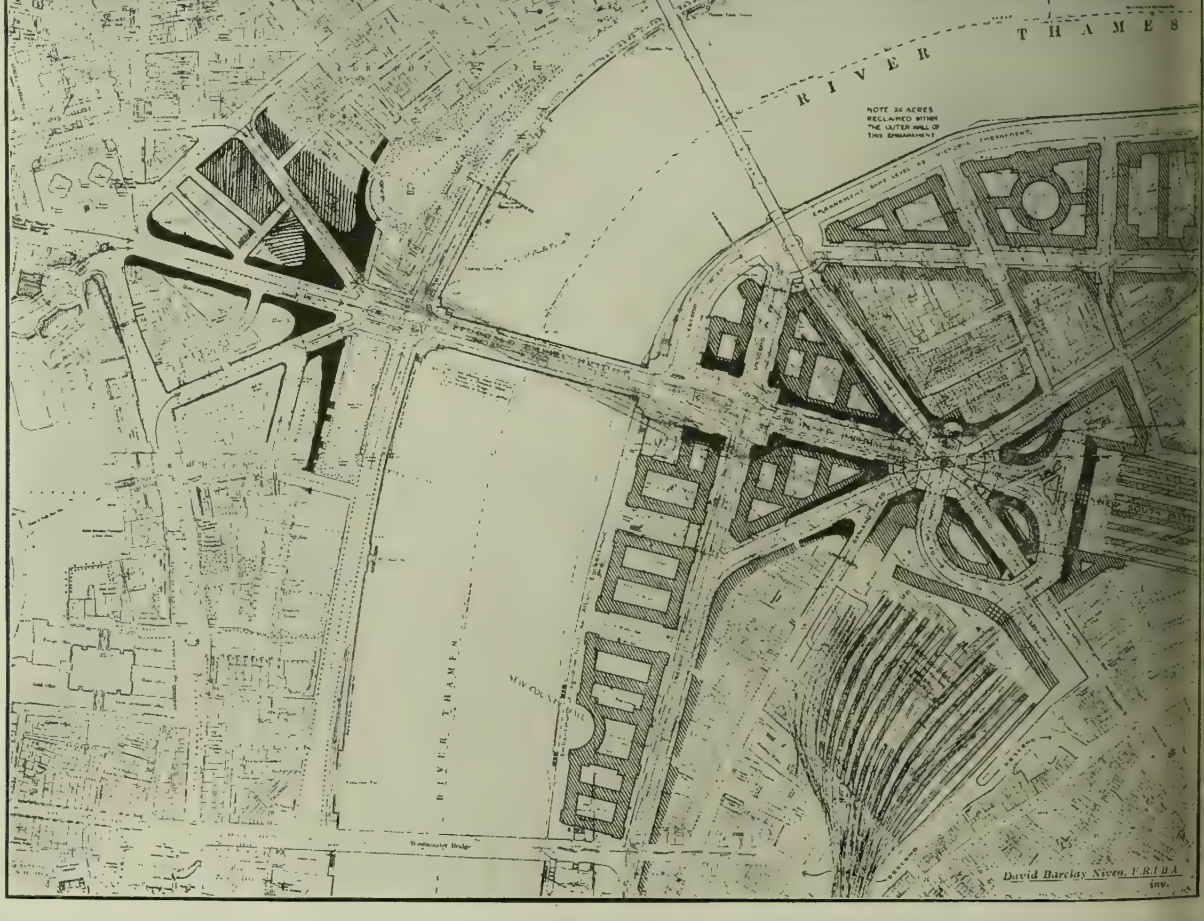
Public Baths, Concert and Dance Hall, Rawmarsh.

This building is in the grounds of Rawmarsh Hall, the hall and grounds belonging to the Council. The whole of the building is of reinforced concrete. The swimming pool is 75 ft. by 35 ft., 3 ft. 6 in. and 6 ft. 6 in. deep, and lined with white glazed tiles, and is furnished with diving stage and springboard, etc. The cubicles are removable. The stage is the full width of the building and 21 ft. deep. Slipper baths for men and women are provided. Water is continuously purified, a peak load being 20,000 gallons per hour, or the whole of the water can be circulated for purification in four hours. The whole of the floor space within the walls of the large hall, or bath, is covered in winter for dancing and concerts, and is an oak spring floor. The cost of the whole building has been about £22,000, including chimney, laundry, boiler, purification plant, and everything complete. The cube is 304,000 ft., cost per cubic foot working out at about 1s. 6d. Rawmarsh Hall adjoining is to be utilised for refreshment rooms and manager's residence, but these alterations have not yet been made.

Mr. J. A. Tonge, L.R.I.B.A., is the architect.

The Rialto Cinema, Hall Green, Birmingham.

This cinema has been erected for the Springfield Picture Playhouse Co., Ltd., on a site in Stratford-road, Hall Green, Birmingham. The principal elevation is of brick, with stuc panels relieved with tiled dressings and crowned with a well designed cornice in terra cotta. The walls of the vestibule are tastefully decorated in replica marble in harmony with the marble floor. The lounge hall is well arranged and spacious, and the entrance to the pit is conveniently placed. The ticket issuing office is in oak, and contains several pieces of stained glass designed *en suite* with the panelling. From its terrazzo floor to the pastel blue of its dome ceiling the lounge hall is typical of the labour which has been expended in blending every detail into its ap place in the main scheme of deco



The grand staircase is broad and leading by easy stages to the foyer hall. The "Rublino" flooring used out this portion is in quiet shades The colour scheme adopted for th of the building is quiet, restra restful.

The fibrous plaster decorations ceived in classic vein. The colour in mellow tones of parchment, c gold, panels blended from deep delicate azure blue, and trophies in blue and green. The great arch wh the ceiling forms a canvas for oil depicting a struggle between oppos at the Olympic games. The light have been designed to harmonise decorations and arranged to enha effect. Flambeau torches are em illuminate the main walls, with am translucent fittings in the ceilin general lighting is soft and mellow. entire absence of glare.

The ventilation has been arrange monise with and assist the gener The screen is of ample size. Fron tion is adopted from the operato situated under the balcony, whe Ross machines have been installed. velour has been chosen for the stage the colour being a deep shade of cr harmonise with the wall panels. The is carpeted with super-Wilton in qui of grey, blue and mauve in harmony decorations. Seating accommodation vided for just under 1,000. Every the house is a tip-up chair, those in cony being specially designed to af ceptional comfort.

Mr. Hurley Robinson, F.R.I.B.A., architect.

The builders were Messrs. E. G Ltd., the principal sub-contractors

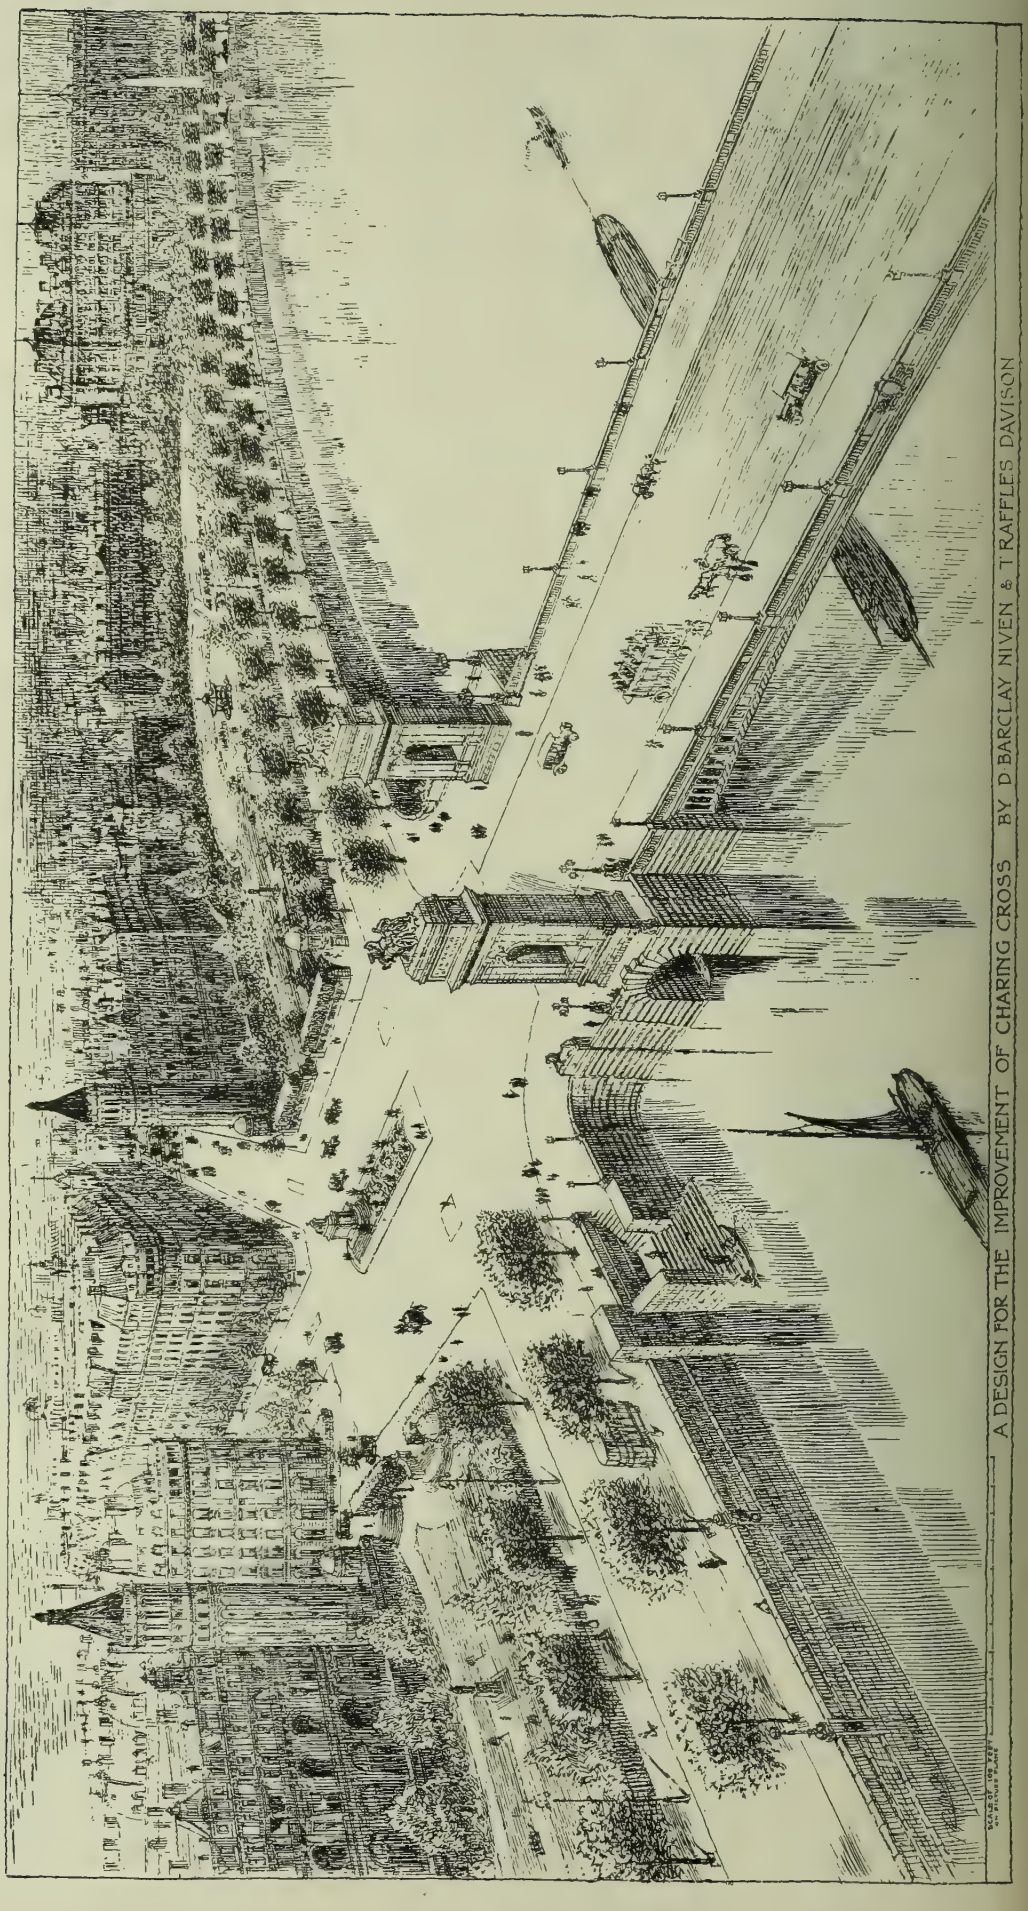
Plan of Vehicular Bridge over the Thames at Charing Cross, showing proposed South Side Embankment, new Site for Railway Station, etc. By Mr. D. BARCLAY NIVEN, F.R.I.B.A.

oring Co., Ltd., wood block floor; s and Crafts Guild, fibrous plaster-painted decorations; Thos. Ash ventilation; Asphalte and Cement asphalt work; Bagley and Parker, Binks and Co., sanitary fittings; m Concrete Steel Co., reinforced work; Colman and Co., electric reston Cribb, oil paintings on Durus Tile Co., glazed tiles; Station Brick and Terra Cotta Co., : Hunt and Co., electric light fit-skins and Sewell, Ltd., steel case-d staircase balustrading; Ioco .. rubber flooring; Marble Art and fts, Ltd., replica marble in vesti-bule; Marbello, Ltd., terrazzo floor; Nortons (Tividale), Ltd., constructional steelwork.

Rotherham Municipal Technical College and School of Art.

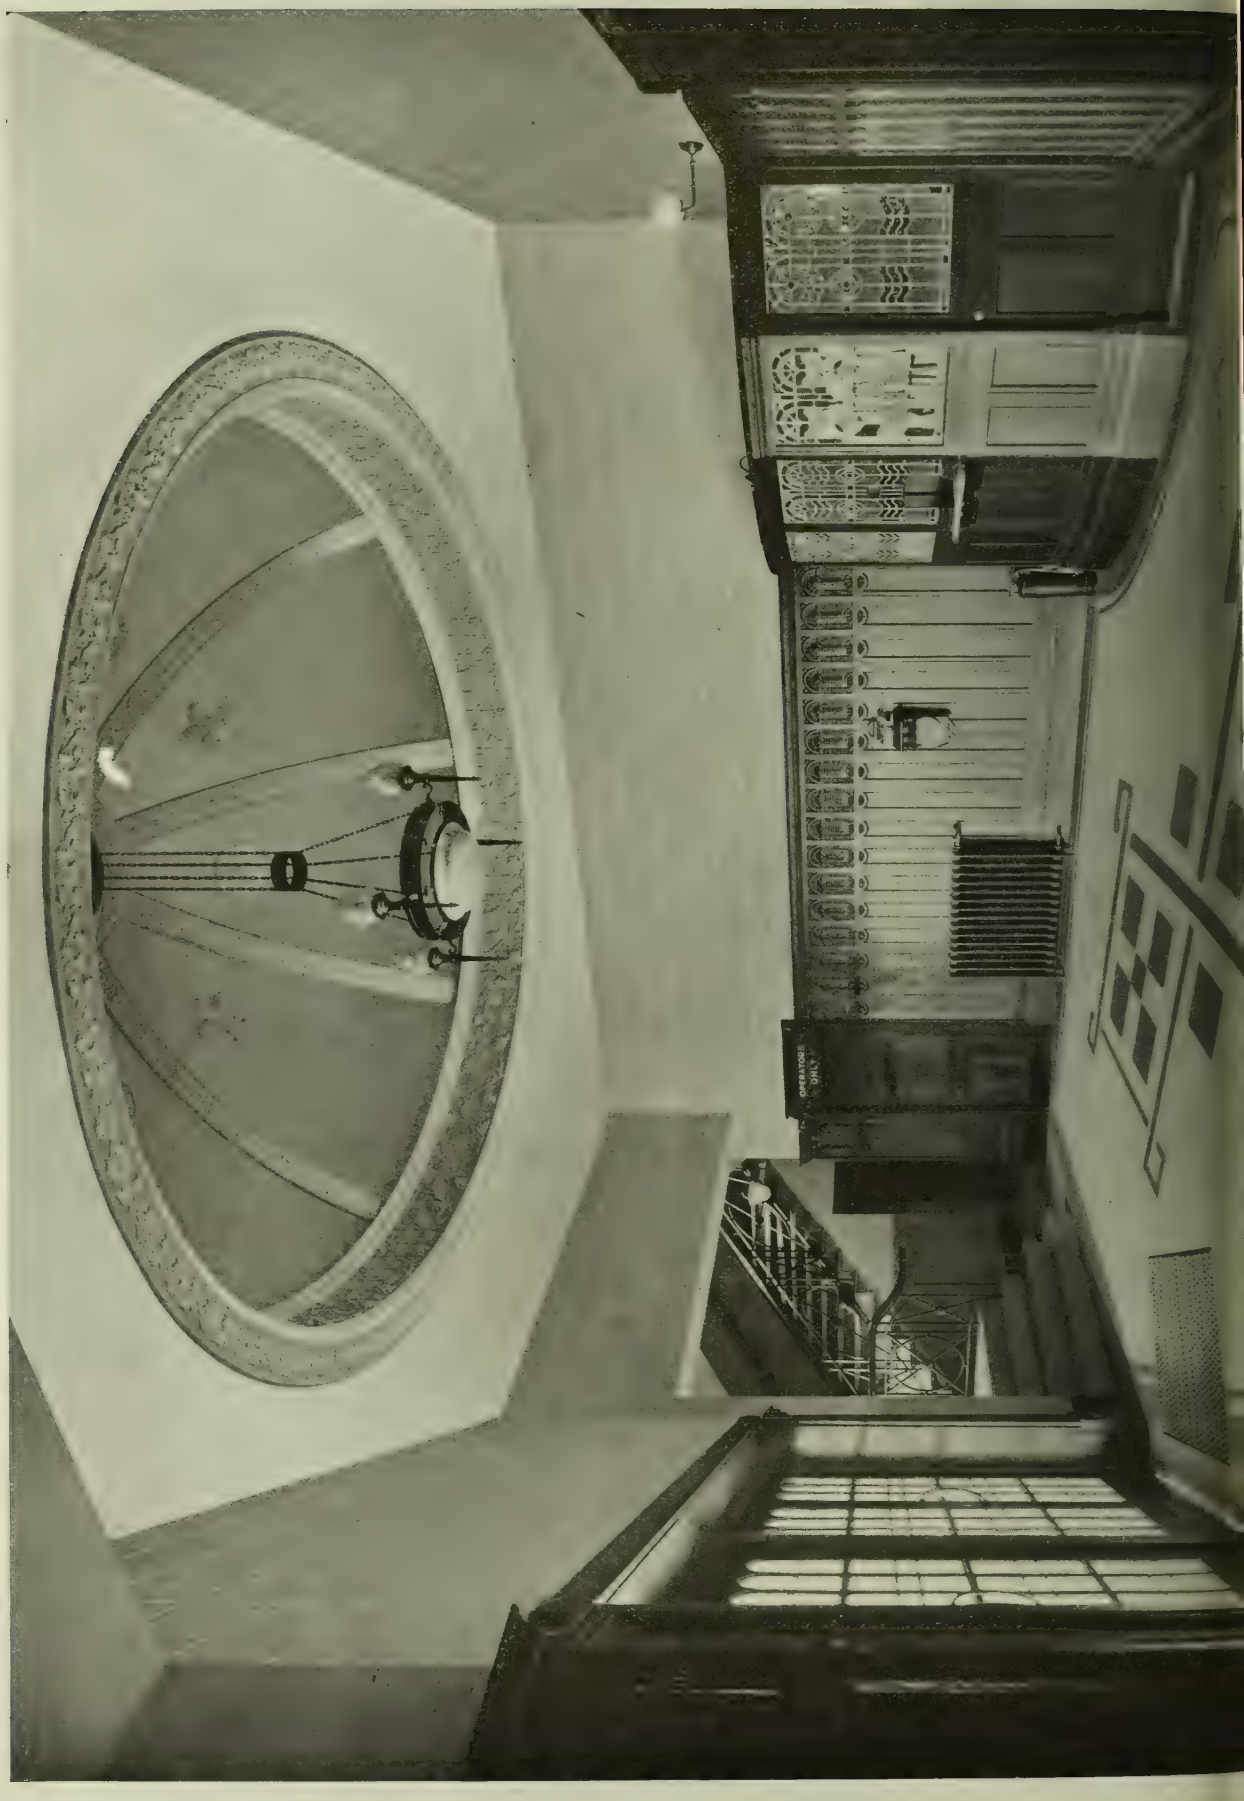
We illustrate this week the winning design in this competition, by Messrs. A. F. Scott & Sons. The full awards of the assessor, Professor S. D. Adshead, are given on page 928. The successful design is of interest for a rather unusual treatment both of plan and elevation.

Practical Homes Competition.



In this competition, which was promoted by the *Lady*, a cash prize of £250 in Class A has been awarded to Mr. R. Kitching Ellison, A.R.I.B.A., whose design we illustrate by photograph and plans this week. The house exhibits a sound and convenient plan and elevations which, though simple, are of satisfactory proportions and character.

Design for a Scottish War Memorial.



This design was prepared from plans by the late Viscount Leverhulme, who commissioned Mr. Raffles Davison to design the exterior. The idea was to have a series of floors; round the walls of each were to be inscribed the names of all from the locality of the Memorial who served in the War of 1914-18. The crowning stage was designed to have a lantern light which would be seen far out to sea.

retary,
oyal Institute of British Architects.

4th November, 1927

I have now brought your letter of 23rd before the Council of the Royal e of British Architects, and in reply ked to call attention to the statement the Prime Minister on March 16th. the effect that the Government "will ared to contribute to the scheme if, amination of its engineering, financial hetic aspects, it appears satisfactory." this means that an architectural in- to follow the engineering one, which lly be the case, it would appear to be for the architectural standpoint to esented on the present Committee of and especially so because the leading tural considerations are the question level of the bridge in relation to the the alignment of it as affecting the of sites for important buildings, and, portant of all, the question of whether dge should carry both roadway and a or the railway be taken under the some convenient point.

esign of the bridge itself as an archi- composition is, of course, very im- but these other considerations, and many more, are fundamental, and certainly not be dealt with by en- alone.

directed to express the hope that the may have further and very serious ation, and that steps may be taken to that the architectural aspects of the problem may be dealt with on broad lines at the outset.

I am, Sir,

Your obedient Servant,

(Signed) IAN MACALISTER, Secretary.

J. S. Pool Godsell, Esq.,
Ministry of Transport,
Roads Department,
Whitehall-gardens, S.W.1.

28th November, 1927.

SIR,—With reference to my letter of August 9th, 1927, your reply of August 23rd, 1927, and my last letter of November 4th, 1927, to which I have not yet received a reply, I am desired to point out to the Minister of Transport that the subject of this correspondence is one of very great interest to the architectural profession, and that it is desirable that the attitude taken by my Council in the matter should be made known without delay. My Council therefore desire me to send at once to the public Press copies of the correspondence that has passed between us. Before this action is taken, I shall be obliged if you will kindly let me know whether the Minister of Transport has any objection to such publication.

I am, Sir,

Your obedient Servant,

(Signed) IAN MACALISTER, Secretary.

J. S. Pool Godsell, Esq.,
Ministry of Transport,
Roads Department,
Whitehall-gardens, S.W.1.

Ministry of Transport,
Roads Department,
Whitehall-gardens, S.W.1,

1st December, 1927.

SIR,—I am directed by the Minister of Transport to refer to your letters of the 4th and 28th November on the subject of the investigation which is now proceeding into the question of the construction of a double-decker road and railway bridge at Charing Cross. I am to enclose a copy of a Parliamentary question which was addressed to the Minister on the 29th November and of the Minister's reply. As stated in this reply, the examination of the scheme of the Royal Commission is for the present directed primarily to its engineering and financial aspects. Your Institute may rest assured that the Minister recognises the importance of architectural considerations which must arise in connection with a project of this kind, and that they will not be overlooked; but he does not consider that any useful purpose would be served by an examination of the architectural and æsthetic aspects of the scheme until its general features, which must depend on engineering and financial considerations, have been investigated.

I am to add that the Minister has no objection to the publication of this correspondence in the Press, should the Royal Institute of British Architects so desire.

I am, Sir,

Your obedient Servant,

(Signed) H. H. PIGGOTT,
Assistant Secretary.

The Secretary,
Royal Institute of British Architects.

[PARLIAMENTARY DEBATES, HOUSE OF COMMONS, NOVEMBER 29, 1927.

CHARING CROSS BRIDGE.

Sir William Davison asked the Minister of Transport whether he could inform the House as to the progress which has been made by the Committee of Engineers who were appointed in March last to examine the scheme of the Royal Commission for a double-decker road and railway bridge at Charing Cross, having regard to its engineering, financial and æsthetic aspects; and when it is likely that their Report will be submitted to Government and to Parliament.

Colonel Ashley: The examination of the scheme of the Royal Commission for a double-decker road and railway bridge at Charing Cross is for the present directed primarily to its engineering and financial aspects. The problem is one of great difficulty and complexity, and although all possible progress is being made, I do not anticipate that the engineers charged with the investigation will be in a position to report before next spring. I should add that the engineers received their instructions on May 14 last, and not in March, as stated in the question.]

R.I.B.A.

The New Delhi.

We learn that Professor C. H. Reilly is about to visit India for the purpose of writing the architectural section of a book on the new Delhi, by Lord Lytton and himself. Lord Lytton dealing with the historical part of the work. Sir Edwin Lutyens and Sir Herbert Baker have agreed that Professor Reilly should describe their work. Professor Reilly leaves by the P. & O. s.s. "Ranchi," from Marseilles, on December 30, and will be back on March 2. While travelling in India he will be the guest of Sir Edwin Lutyens, whom he will accompany. He has received an invitation from His Highness the Jam Sahib of Nawanagar, popularly known as Ranjitsinjhi, to stay with him at Jamnagar.

THE ROYAL ACADEMY STUDENTS' PRIZE DISTRIBUTION

THE exhibition of R.A. students' work at Burlington House this week is the most disappointing we can call to mind. Design, drawing and colour are, generally speaking, about the poorest in quality we remember. The R.A. gold medal and Edward Stott travelling studentship of £200 goes a-begging. One of the designs in this competition shows some ingenuity of plan in a scheme for banking premises, and rises to the heights of Badminton courts and putting greens on the roof, but there is not even a small amount of distinction in the elevations of this or the other designs. In the upper school the Landseer prize of £20 and silver medal is awarded to Clifford Sidney Wm. Strange for a public school chapel. The somewhat gaunt proportions are not happy, and an interior like this with its large spaces of plain walls between the three lofty, round-arched windows would be somewhat forbidding. The design No. 167 is really a better architectural composition, and is, in fact, nicely proportioned, though it would obviously be a very inadequately lighted building. In the lower school a good design by Jas. Arthur Schofield is awarded the first prize of £10 and a silver medal. The second prize is awarded to Henry Collingwood Farmer, whose design is better than his presentment of it. A rather good design for a commercial building is No. 187.

No award is made for the measured drawings prize, and one can hardly wonder this is so.

Though the prize for a cartoon of a draped figure is not awarded, there was exhibited one, numbered 52, of some distinct merit. The subject of a design in water colour has not elicited much, but the prizes are won by Edith A. Saunders first, and Lilian Dorothy Sawyers second. The latter shows a good decorative feeling. Sculpture seems to attract women students, and they are again successful. A large amount of paintings and of studies of the figure were exhibited, but we could wish there was more evidence of ideality and imagination, even if there were merely clever technique in drawing and painting.

SIR FRANK DICKSEE, P.R.A., presided at the annual prize distribution of the Royal Academy Schools, held on Saturday last, at Burlington House. Amongst those present were :—Sir Reginald Blomfield, R.A., F.R.I.B.A., Sir David Y. Cameron, Sir George Clausen, Sir Frank Short, and Messrs. Walter Russell, Charles Hartwell, Henry Poole, Spencer Watson, Julius Olsson, Arnesby Brown, and Melton Fisher.

Addressing the students, Sir Frank Dicksee urged them never to lose hold of two principles—one, not to allow any form of ignorance, apathy, or folly to induce them to abandon what their predecessors' quests had already won for them; and, two, in whatever ways they wandered, to have and retain a reverent understanding of nature. Some there were who, seeing that many of the finest examples of art had in them something which was above and beyond, and, therefore, differed from everyday nature that they saw around them, grasped only that difference, and, ignoring the principle that guided it, imagined that they displayed genius by deviating from nature in any manner they might choose, however morbid, unwholesome, or contorted that might be. The extreme expression of this mentality was one of the sinister signs of the present day. It was difficult to understand how it had arisen, but it might have been a protest against a certain insipid pleasantness or prettiness which was at times associated with Victorian art. There was now in certain quarters such a deadly fear of prettiness that, in order to avoid any suspicion of its presence, any sin was considered not only justified but admirable. The old standards of beauty were abandoned, and a new order founded on a negroid or other barbaric type usurped their place. This curious and unnatural madness could be traced through most parts of this semi-civilised world, but he believed it had less hold on this country than was generally supposed, and on that account it might be said that British art was in a more healthy condition than that of any other country. In fact, he gathered from more than one art centre abroad that this acknowledgment of our sanity was made. Fortunately, if endowed with a healthy mind and sound judgment, none need succumb to this malign influence, and there was a panacea that would serve all those who were in doubt. It was a combination of two ingredients — knowledge and sincerity. He wished to conclude with one word of advice to each of them—look in their own soul and learn what they truly loved. Express that with all their strength and with all their sincerity, and if they were true to themselves, they could not be false to the art they wished to serve

PRIZE LIST.

Landscape Painting.—Turner Gold Medal and Scholarship (£50) : Lilian D. Sawyers.

Landscape Painting.—Creswick Prize (£25) and Silver Medal : Violet P. Goold.

Design for Public Building Decoration.—1, Landseer Prize (£30) and Silver Medal : Edith A. Saunders; 2, Landseer Prize (£10) and Bronze Medal : Lilian D. Sawyers.

Composition in Colour.—£5 and Silver Medal : L. H. Wells.

Two Paintings of a Figure from Life.—1, £10 and Silver Medal : Violet P. Goold; 2, Bronze Medal : Marjorie Brooks.

Portrait Study of a Lady in evening dress showing arms and hands.—Arthur Hacker Prize (£30) and Silver Medal : Elsie D. Hewland.

Painting of a Head from Life, life size.—Arthur Hacker Prize (£20) and Silver Medal : Lilian D. Sawyers.

Set of Four Drawings of a Figure from Life (best finished drawing of a head in any set).—1, not awarded; 2, £5 and Bronze Medal : R. D. Greenham; 3, £5 : L. H. Wells.

Drawing from the Antique.—£5 and Silver Medal : R. D. Greenham.

Composition in Sculpture.—R.A. Gold Medal and Edward Stott Travelling Studentship (£200) : Lilian E. Birch.

Model of a Design.—1, Landseer Prize (£30) and Silver Medal : Alice B. Tippin; 2, Landseer Prize (£10) and Bronze Medal : Ethelwyn Baker (ineligible through having received the same prize before).

Two Models of Busts from Life.—£5 and Silver Medal : A. J. Marshall.

Model from the Antique.—£5 and Silver Medal : A. J. Marshall.

Design in Relief, containing figure and ornament.—£10 and Silver Medal : A. J. Marshall.

Set of Three Models of a Figure from Life.—1, Landseer Prize (£30) and Silver Medal : Alice B. Tippin; 2, Landseer Prize (£20) and Bronze Medal : A. J. Marshall.

An Architectural Design.—Landseer Prize (£20) and Silver Medal : C. S. W. Strange.

An Architectural Design.—1, £10 and Silver Medal : J. A. Schofield; 2, £5 and Bronze Medal : H. C. Farmer.

Landseer Scholarships in Painting and Sculpture, of £40 a year each, tenable for two years.—In Painting : Dorothy M. Barber, E. C. M. Hall, and Edith A. Saunders. In Sculpture : Alice B. Tippin.

SOCIETIES AND INSTITUTIONS

MANCHESTER SOCIETY OF ARCHITECTS.

THE Manchester Society of Architects December 8 held their annual dinner. Harry S. Fairhurst, the president of Society, was in the chair, and the chief g was the President of the R.I.B.A., Walter Tapper.

The Lord Mayor, responding to the t of "The City of Manchester," referre the darkness of Manchester and to the re improvement in its buildings, remarking it was good that architects now studied only the framework of a building but work that was to be carried on inside Manchester would be a long time, no do before it approached the beauty of E burgh, but a number of new buildings a credit to their architects. He could gratulate the business men on their fores and fearlessness in face of bad trade. was almost ashamed to mention the old Library. They had planned a great b ing, but when they had the plans they finished with it. They were quite clients of the architects for the Art Gal They got to work to get plans and gave stantial prizes. They got the plans and they finished. He was, said the speaker ceedingly sorry for that; but notwiths ing all this pessimism they would get Library. Replying to the question "Wh the Lord Mayor said that it would n so very long; in a month or so the Co met again, and he was not the Lord M if the resolution was not carried. Wh the Town Hall would be extended or nc city would get its Library. Naturally Corporation had got plans for the whc the proposed structure; but having done it did not matter if the Town Hall e sion was not built for another twenty y they could still go on with the Library. Lord Mayor, in conclusion, paid a co ment to the architect of the Ship building (Mr. Fairhurst) and to the buildings in Cross-street. These desi he said, had come up to date, thus all business to become orderly and efficient.

In proposing the toast of the R.I.B.A Fairhurst referred to its parental pc and care over the 26 allied societies the British Isles, and the 14 in Africa, tralia, New Zealand, Canada, Burma, and Singapore. He believed there great future for the architects of the I speaking world, and he thought that in chester architects were doing their fair of the work of building. He though were doing something better than hac done during the preceding thirty years

Mr. Walter Tapper, P.R.I.B.A., re to the toast, said the Manchester Socie one of the oldest, strongest, and mo tinguished of the allied societies i British Empire. It sent to the Cou the Institute some of the wisest anc public-spirited of men. The Institu now linked in affection and respect w its allied societies. Yet all their join would be wasted unless it resulted i architecture. To be a man of educati a man of culture was needed to-day than anything. The expression of things in building was the purpose for the Institute and the allied societies e One did not get refined buildings unle were refined themselves. He would think that the middle of the nineteen tury was part of our time and to cla it the great Free Trade Hall with it history, which was really a great mon Edward Walters, its architect, should in gratitude by every Manchester ma Cockerell's Bank of England, Manches a really noble building. Such thing only be done by men of refined tas noble character. Of more modern tim had the Arts Building of the Universi

House, Blackfriars House, the Ship House, and other fine buildings, evi- that architecture was alive and ing in Manchester. He wished to n also two buildings of inestimable nd practical value, the Cathedral and m's Hospital. Only recently the ation had projected a very great , the extension of its municipal build- d the building of a great library. He pe that great scheme would go for- It was a matter of congratulation e merchant princes of the city did see nd more clearly how closely architec- as allied with commerce. They began that it was really an asset. If he read gns of the times aright, their offices ctories were receiving tremendous con- ion. Unless the corporations of such as this and the men in their streets desired greater architecture it would ossible to get it. Civic pride was use- ithout that knowledge, and the archi- ust have in addition a love and venera- or all the traditions of his art. No n need arise about his originality, and actical needs of his age would give a f genius plenty of opportunity for thought and expression.

DINBURGH COLLEGE OF ART.

l Provost Alexander Stevenson, in the f the Edinburgh College of Art on last, presented diplomas and certifi- for the session 1926-27 to students of llege. The function was attended by agistrates and members of the Council, G. Washington Browne, LL.D., Presi- f the Royal Scottish Academy, and by uncil of the Academy.

Gerald Moira, A.R.W.S., Principal of llege, referred to the past year as a successful one. Twenty-nine students the diploma at the end of last session, ey all gained that distinction. The ents for the past session were 1,253 ts. The following is the list of awards : itecture Diploma.—James Drummond, N. Mackintosh, Alfred Sinclair.

itecture Certificate.—Kenneth A. Begg, G. Hardie, Hugh Hawson, Robert H. w, John B. Moffat, Hugh S. nald, Norman A. G. Neil.

wing and Painting Diploma.—Jean Harold B. Bell, Vida M. Gardiner, Gemmell, Robert S. Irvine, William adbetter, A. Winifried C. Lorimer, m F. R. Rayner, Robert H. Westwater.

pture Diploma.—Violet L. Mackenzie.

gn and Crafts Diploma.—Margaret Arnot, Alice Irene Baron, Christine . Cairns, Katherine M. A. Cook, ret R. Crow, Mary G. Elliot, Margaret , Isabella R. Jeffrey, Catherine H. on, Helen W. Kemp, William Murray, ret I. MacArthur, Colin Macnaughton, ret M'Phail, Elizabeth R. Paterson, G. Sym.

following scholarships and bursaries, e during the current session, were ed :—

velling Scholarship—School of Drawing ainting.—John Maxwell, £120.

ntenance Scholarships of £66—School of ing and Painting.—Robert H. West- , William F. R. Rayner. School of De- nd Crafts.—William Murray, Katherine Cook (declined), Margaret H. S. Arnot. ool of Sculpture (Studio and £16 Bur- —Violet L. Mackenzie.

or Travelling Bursaries—School of Draw- nd Painting (£20 each).—Keith E. , William M. M. Twaddle. School of n and Crafts (£15 each).—Gilbert G. tt, Dorothy M. E. Cromb, James C. t, Ruth J. Arnold.

son-Harvie Bursaries of £20 each—De- nd Lithography.—John Bell. Design, ng and Decoration.—James Paterson.

ool of Architecture — Maintenance rship of £40.—Basil Spence. Minor lling Bursaries of £10 each.—David G. erman, George M. Thomson, Hugh on, John B. Moffat.

BOOK REVIEWS

Raffles Davison: A Record of His Life and Work, 1870-1926. Including a Collection of his Drawings and Sketches. Edited by Maurice E. Webb, M.C., M.A., and Herbert Wigglesworth. £1 1s. net.

It is a pleasure to notice this attractive book. The many charming sketches it contains, the various appreciations by some of the artist's friends, the many distinguished names appearing as guarantors and subscribers, and the circumstances which led to its production, give to the volume an unusual interest. Mr. Davison is a well-known architectural draughtsman, and it will be remembered that, following an exhibition of his pastel work and sketches in the galleries of the Royal Institute of British Architects, several of his admirers, thinking there should be a permanent record of his work, suggested in our columns the publication of a memorial volume of some of his sketches, and the result is the book before us. In one sense the volume will be a disappointment to the artist's friends, for though the illustrations it contains are representative, they are but a small part of the many thousands of drawings and sketches of ancient and modern architecture, craftsmanship, wayside bits, and various objects made by an artist of keen observation during a long and active life. From such a vast collection of material it was impossible to select all the subjects of charm and distinction which should have found a place in such a collection, but within the limits of space imposed upon them the editors have made an excellent selection and can be congratulated on what must have been a difficult task; but we may hope, should a subsequent edition be called for—as we hope it may—a more comprehensive selection will be possible. The 117 examples included in the volume are admirably reproduced in line and half tone, and while some of them, such as the interior of Liverpool Cathedral, the Houses of Parliament, etc., have been selected to show the skill of an architectural draughtsman who possesses a style of marked individuality, most of them are examples of old architecture and craftsmanship, wayside bits, and details from all parts of the country, sketched with a sympathy and feeling which appears to enhance the charm inherent in many of the subjects shown. The artist draws with truth and without any irritating tricks of draughtsmanship, and these sketches indicate the possession by their author of a pictorial sense, a sense of scale, and an instinct for selecting a point of view.

The volume includes a foreword by Sir Aston Webb, and in addition to a preface by Sir Reginald Blomfield and notes by the Editors and others, it contains a valuable essay on the art of drawing by Mr. Davison himself, a perusal of which, with a careful examination of the sketches, will do much to explain the note of sincerity in his work as well as its charm and technical efficiency.

The volume has been admirably produced by Messrs. Batsford and published at an appropriate season. It should prove to be an excellent students' gift-book.

London Rebuilt, 1897-1927. By Harold Clunn. (John Murray.) 316 pp.; 150 illustrations. Demy 8vo. Cloth, 18s. net.

The sub-title of this useful and satisfactory book reads: "An attempt to depict the principal changes which have taken place, with some suggestions for the further improvement of the Metropolis." It is, in effect, considerably more than an attempt; but it is in the nature of things that a picture of London can never be complete. London is perpetually in the making and re-making, and perhaps the last 30 years exemplify this fact more than would any other period we might point to in her long history. In no sense of detraction from the book's value, we cannot help remarking that many pages became out of date in the short interval betwixt the correction of the proofs and their running through the press. It is probably not many weeks or months since Mr. Clunn wrote (on page 85) his note on the old Exeter Hall site in the Strand, where stands the Strand Palace Hotel, then wedged in between two sections of Haxell's Hotel, "which is to be pulled down when an extended frontage to the Strand is to be erected for the Strand Palace Hotel." To-day, whilst this notice is being penned, there are two yawning gulfs where Haxell's stood, and doubtless before the appreciation goes to press the great gantries will be working on the steel girders for the hotel extension. It seems but the other day that Grosvenor House, in Park-lane, was a stately mansion with a walled garden; the next day the housebreakers had cleared the site and over the week-end the excavators had dug a hole which would contain St. Paul's Cathedral; and to-day the mighty town of flats is in essence, if not in being. Naturally, such rapidities are more apparent than real, just because London is so vast that the average citizen does not compass the whole in the course of a month's peregrinations.

The author is very happy in his illustrations from photographs; always two to the page, they generally show the site (*a*) as it was a few years ago and (*b*) as it is now or was recently; *e.g.*, Old Devonshire House, Piccadilly, in 1924, with its lovable ugly wall to the street, gate-posts and classic urns, and then the building operations in progress on the site in 1925. A picture of the new Devonshire House in 1927 would tell another story. Two well-contrasted pictures show, one, the old wharves on the Surrey side of the Thames by Westminster Bridge, and the other, the County Hall.

The book is not only useful in showing what has been done in London's modern rebuilding, but what may be, nay, certainly will be, done in the near future. Think of Woburn-place, Russell-square, that home of Victorian respectability—and then visualise it as it will be in the near future. It was, as the author reminds us, widened in 1922 from Russell-square to Tavistock-square, and on the site—the length of a not very short street—the new Royal Hotel is under construction, and when completed will contain upwards of 700 rooms.

Whilst not dealing at length in architectural details and technicalities, as such, this book will appeal to architects generally as a useful work of reference, recording those things which are taking place in the remodelling of the city.

Modern Plasterwork Design. By George P. Bankart and G. Edward Bankart. London: 9, Queen Anne's Gate. Price £2 15s.

It is to be regretted that the plasterer's art should be neglected as it appears to be to-day. The old examples when met with always excite the interest of people who have a love for our ancient homes and buildings. Mr. Bankart, in his introduction to this folio, attributes the lack of its use to-day "to the blind and slavish copying of old examples." To overcome this he has prepared one hundred designs to scale suitable for modern craftsmanship. As it may be imagined by those who know the author and his work, these designs rank high. His designs for ceilings in low relief for small rooms leave nothing to be desired. The motif of decoration is always in scale with the room, and the simplicity of its detail is admirable. The portfolio also illustrates designs for external work, ceilings for larger buildings, and chimneypieces and friezes, all very suitable for their purpose, and recognising in all cases the material dealt with. We commend the folio to architects who are looking for a cheap, effective, and lasting form of decoration in our middle-class houses. We regret to say that the authors' brother, Mr. C. J. Bankart, recently passed away.

A Correction.

In connection with a misprint which occurred on page 895 of our last issue, Mr George P. Allen, F.R.I.B.A., writes to point out that he is the architect to the Bedford School buildings at Bedford and surveyor to the Governors of the Harpur Charity.

REGIONAL PLANNING IN THE WEST RIDING

AMONG the Regional Town-Planning schemes now being elaborated in the great centres of industry of the Midlands and the North of England there are many which, in addition to the usual problems of extension, industrial expansion, transport, and the public utility services, have some special condition, either of a predominant industry, as in the Manchester, Sheffield, and Doncaster Regions, or some marked physical characteristics which dominate the general lines of the scheme. There are comparatively few cases where both problems occur in an almost equal degree such as is the case in the district having Leeds and Bradford as its twin centres. Here is a region full of interest for the town-planner where almost every difficulty can be found from the problems created by the soulless industrialism of the nineteenth century to the natural difficulties of moorland crags, deep valleys and steeply rising gradients.

The report of the Leeds and Bradford Region Joint Town-Planning Committee* has, therefore, considerable interest to those who know something of the peculiar difficulties which confront any town-planner in the West Riding of Yorkshire.

This preliminary report is, no doubt, chiefly intended to stimulate and arouse public interest in the cause of orderly and reasonable development on some definite plan before the whole district is marred by the unconscious, or perhaps sometimes the cynically conscious, indifference of industrial development to its own real needs. It also represents the first stage in any town-planning scheme; research, and the collection of information on all the factors which may contribute to the solution of the problem.

This material is arranged in a logical sequence, and after the foreword and introduction, comprises a historical survey, a chapter on the physical characteristics of the region, another dealing with increase and decrease in population, a survey of the predominant industries, a general and detailed examination of the roads and traffic routes as existing and as proposed, a chapter on public utility services, a survey of parks and open spaces with suggestions for new reservations, and finally a chapter on the progress of town-planning in the region.

In the introductory chapter one paragraph is especially worth quoting: "Difficulties have been created by the old unplanned development. . . . The whole tendency . . . has been for each generation to do things which seemed necessary to meet immediate needs without giving any thought as to whether its work would have to be undone later at great expense." Here in a few words we have an excellent definition of the need for town planning in areas due for industrial expansion.

In this region, as in most others where continuous development is proceeding, the effects of such development stretch far beyond the limits of the industrial centre from which they originate. Like the ripples in a pond, they radiate over the whole surface and are reflected from each obstacle they encounter. It is obvious and now generally admitted that town planning is inadequate in such cases, and must give place to a comprehensive survey of a whole region; by this means, coupled with the co-operation of all the local authorities in the given area, may success be ultimately achieved. We do not underrate the difficulties which have to be faced by the surveyor to a joint committee, but, in the words of the report:—"The Regional Surveyor, being employed by all the authorities, can act as liaison officer between them and so bring about a fusion of ideas from which better collective results may be expected. . . . The fact that the planning is being done in a spirit of co-operation makes possible the inclusion of suggestions which might otherwise be sacrificed to local prejudice."

In the industrial north they have even gone further, and inter-regional conferences between Manchester, Sheffield, North-East Lancashire, and the Leeds and Bradford Committee have ensured the intelligent and logical application of the principle of town planning right across the heart of industrial England in the northern centres.

The particular area which we have under consideration has a long and chequered history; development alternating with destruction or decay from time immemorial. It was a centre of some importance in Roman times, indeed the Roman system of roads has left a permanent trace on the region which has influenced every succeeding age. In mediæval times the great part of the region gave feudal allegiance to the Bishop of York, and later became—largely owing to the influx of foreign settlers—an increasingly important centre in the wool and worsted trade.

With the introduction of power looms and machinery operated by steam, a great increase of prosperity and business gave Leeds and Bradford a predominance over all local rivals, and this seems to increase rather than diminish. In the section of the preliminary report devoted to the geology of the region we see how this development was encouraged by two factors of importance: the abundant supply of soft water coming from the high lands of millstone grit formation to the west, and the numerous streams which provided cheap and convenient power before the general adoption of coal for industrial purposes.

Broadly speaking, the region may be divided into two sections of different physical characteristics and different types of development springing from these. To the north the problem is mainly one of preservation, especially as regards open spaces and natural beauty spots which abound on the high moors and steeply sloping banks of the Wharfe and its tributaries. To the south and south-east the problem "is more complex . . . mining and quarrying have been hard at work for more than a century doing their best to destroy amenity," chiefly by the huge unsightly mounds of spoil or "tips" which are the inevitable by-product of unrestrained mining and quarrying. It is suggested that, after zoning, all colliery tips and quarry spoil heaps idle for the preceding five years should be planted with trees and shrubs. This has already been done, as is shown by the following extract from "The Annals of Leeds," published in 1856:—"At Bowling, the accumulated heaps of refuse from the mines, forming huge mounds surrounding the excavations have been planted with trees, which add greatly to the aspect of the neig hood."

In this connection it is observed report that the City of Bradford h powers to regulate spoil banks and ti that "the Forestry Commissioners in plant 32,400,000 trees in 1926, which that about eighteen thousand barren acres will soon be woodland. These will be composed chiefly of quick-g trees . . . and are suitable for pulp the manufacture of paper and artificia And it is suggested that the Commis might usefully turn their attent the barren lands in the region, thus ing the raw material needed for the developing industry of artificial silk al the doors of the factories.

The two other difficulties in this the region are the tendency towards " development" with the gradual filling all the existing open land between b areas, and the related problem of the c of a chain of open spaces, parks and land reservations connected by tree-parkways and avenues to prevent thi

It is interesting to note that th industry—worsted and artificial silk—confined to any particular section region, and thus will probably be entirely by electric power as soon becomes an economic possibility. Th can also be applied to the next most tant industry in the region, coal, is at Temple Newsam, where electric w has been a financial success under th economic conditions of a self-contain The daily movement of the popula the area from their homes to their p business or works, as revealed in the shows that this is greater than migh been anticipated. North of the tw centres of Leeds and Bradford the movement of workers in urban and districts is preponderatingly outward south of these cities the number of journeying inwards to the rural and districts is, in some cases, greater th outward movement. This, considered nection with the high infant and mortality rates, is an argument in fa the application of town planning to th up areas at present excluded from tow ning schemes. The contrast between bad housing and the new municipal s near Leeds and Bradford is emphasi the various illustrations in the report

It will be interesting to see the definite proposals contained in the final which will shortly be prepared by th committee, and we have no doubt tha scheme (based as it will be on this th and comprehensive survey) will confer ing benefit on the whole region.

From the Leeds and Bradford Region Joint Town Planning Committee's Report.

City of Wakefield: Lupset Housing Scheme.

* Preliminary Report prepared for the Committee by the Report Sub-Committee. R. H. Mattocks, M.T.P.I., Chief Surveyor; T. Thornton, Hon. Secretary.

HE USES OF PILING IN STRUCTURAL ENGINEERING

M. J. McCarthy, A.M.Inst.C.E., uct.E., reading a paper on this sub- efore the Institution of Structural ers at 10, Upper Belgrave-street, on er 8, said that modern buildings, and structures generally, indicated a y to much more massive construction ormerly; buildings, especially those in the restricted spaces available in ties, were built higher; bridges were esigned with large spans and widths pace with river improvements and evelopments; new docks were more e and deeper; all entailed heavy being imposed on the supporting Consequently, ground conditions be very carefully considered by the r before deciding what form the ions of any new structure should nd his decision would be governed to tent by the form of foundations and dition of existing properties near the s these needed to be safeguarded, he new foundation work proceeded. e of piling in some form or other ery materially assist the engineer to e foundation difficulties, and in deal- h the subject it was proposed to out- dern piling practice, with only brief e to relevant historical matter.

tructures should be founded on ground afe bearing value, free from distur- by lateral forces and scouring action. nes the safe bearing stratum was without having to excavate more few feet of the ground surface; on the and, the safe bearing stratum often considerable depth below the ground and must be reached by penetration alluvial mud, muddy sand, and the hrough water-bearing ground, or a f running sand. Where stability was l, as in the case of dock or lock walls, ion in trenches or cofferdams was the ly recognised method of reaching the on level, but in the case of buildings, ion could be carried beyond practical nomical depths; then instead of dig- the safe bearing ground, independent piles were driven from the surface the weak bearing strata, footing into ner ground, grouped as may be neces- nd capped to carry the imposed loads. for foundation work might be classed wo headings:

heet piling used when excavating in s, constructing cofferdams and curtain in these cases having to resist lateral

ndependent bearing piles for carrying ect axial thrust to a safe bearing n.

piling might be of timber, metal, or e, the sheets being formed in most interlock. The use of concrete sheet was confined to permanent work, but and metal sheeting were employed for ary work also. While for temporary timber sheeting was sometimes em- it had given place in recent years l sheet piling. At the beginning of esent century isolated cases were re- of the use of cast iron and rolled sheet piling with a very indifferent f interlock, but it was not until 1909 erious efforts were made to launch steel sheet piling sections on the mar- n the initial stages the user was re- l to one or two particular sections, wadays a wide choice of sections was le to meet all possible conditions; were sections of different weights, medium, and heavy; with rigid or interlocks; of various strength ; of symmetrical or distorted shapes: ow or broad widths; and with prices competitive one against the other. was every encouragement to employ heet piling in place of timber. As to choice of section, it had to be borne in mind when considering steel sheet piling for temporary work that the piles had to be withdrawn, and if it was desired to re-use the piling many times over, a medium section, symmetrical or as near to as possible, with a robust form of interlock, would be preferable. When a high moment of inertia with a correspondingly high strength modulus was desired, it was usual to resort to a distorted or troughed section of piling. Here, again, attention had to be given to the form of interlock, for in order to obtain the full advantage of the high strength modulus, the pile had to be efficiently driven, and firstly, as a column it had to be capable of withstanding the hammer blows and the ground resistance during the driving operations without crumpling at the head or the foot, and maintaining full interlock throughout its length. The head of water or depth of ground which had to be supported by the piling would have to be taken into account. A driven wall of steel sheet piling needed itself to be supported while excavation or pumping proceeded; heavier sections and those with comparatively high strength moduli would not require so many supporting frames of walings and struts as lighter sections. Another consideration was watertightness, and certain interlocking devices were found to be more efficient in this respect than others; if the interlocking contact was secure throughout the length of the driven piles, most sections could be made practically watertight by a little artifice—if the contact was not good, a high pumping bill might be expected. In recent years engineers responsible for the building work in some of our large cities and towns had found the use of steel sheet piling a distinct safeguard against serious collapses. In excavating for the foundations of a new building to be erected on a very congested site surrounded by many old buildings, extreme care had to be taken. In certain parts of Central London the footings for carrying the walls had to be carried down to a depth of over 50 ft. below street level, to found upon the clay bed, and the usual method was to excavate in trenches using poling boards or timber runners, with walings and struts, as the work proceeded to support the external ground. This method, although slow, had in most cases been carried out without difficulty; in one quite recent case, however, excavations were so carried to a depth of 40 ft. before meeting with trouble, namely, running sand. Pumping would not only have been useless, but a source of danger to surrounding properties, some of which probably depended for the stability of their foundations on the restriction of the running sand within its proper area. The engineers concerned quickly decided to employ steel sheet piling, and joist piles, average lengths 11 ft., were driven to form a number of rectangular boxes passing through the 5 ft. of running sand, footing into the clay bed for about 4 ft., leaving 2 ft. standing above the top of the running sand. Having safely confined the running sand within each box of steel sheet piling, it was excavated without drawing off any of the sand outside, the clay bed being reached without difficulty. The piling was retained permanently in position and concreted within for the footings. The value of steel sheet piling in this and similar instances was inestimable.

In a recent serious building collapse, involving the blocking of a main road, the use of steel sheet piling has probably saved months of delay in the opening of the road again to traffic. The first step after clearing away most of the wreckage and temporarily strutting unsafe parts, was to build a reinforced concrete retaining wall, with formation level about 50 ft. below street level. Interlocking steel sheet piling was decided upon for retaining the ground beneath the road while excavating preparatory to building the concrete wall, the lengths being 53 ft. and the length of the wall about 60 ft. It took just under four weeks from the date the order was placed for the piling to the completion of the driving of the wall. Regarding reinforced concrete sheet piling, there existed many examples of its use in permanent works, such as river and sea walls, where it was employed either as a curtain driven below the base of the massed concrete wall in order to prevent scour, or as the actual retaining wall. The arrangement of the reinforcement bars had been made a speciality by a few well-known firms, but in some instances engineers designed piles themselves according to their own particular idea. With the rapid strides of reinforced concrete construction, timber sheeting had had to give way to reinforced concrete for permanent use, but the latter in its turn was finding keen competition from steel sheet piling. The chief point in favour of reinforced concrete sheeting had been that it resists corrosion. Although in some earlier R.C. wharves and walls the steel reinforcement became soon exposed to water action through the porosity of the concrete, with the various waterproofing coatings now available the life of this form of construction could be considerably extended. On the other hand, the advocates of steel sheet piling claimed that good anti-corrosive paints were available for coating steel piled walls, and, further, that steel piling with copper content could now be obtained.

In driving sheet piling, timber, steel, or concrete, an ordinary pile-driving rig could be used, comprising a timber or steel frame, double-drum steam friction winch with boiler, and drop hammer. Two or three sheaves were fitted at the head of the frame, and the under-carriage might be mounted on travelling wheels or just left with a flat base. Such an outfit might be run on rails or mounted on the deck of a barge. The timber pile would be adzed off at the top and fitted with wrought iron ring before driving. For steel piling a driving cap of cast iron or steel with a wood dolley is used, and for the concrete pile a metal helmet with wood dolley. In place of the drop hammer a single-acting steam hammer could be employed, but the capacity of the boiler would have to be increased. Both methods proved effective in driving timber or concrete sheeting, although in the case of the latter the single-acting power hammer was often preferred and specified by engineers. The case was, however, different with steel sheet piling, as the sectional area was always very much less than the sectional area of a timber or concrete pile. For instance, one 15 in. by 5 in. Universal joist pile, complete with clutch, had a sectional area of 16 sq. in., and an 8 in. Simplex pile a sectional area of 4.17 sq. in., as against 36 sq. in. for a timber or concrete pile of 9 in. by 4 in. With piling of small sectional area, the action of a drop hammer or single-acting hammer was much too drastic, and the type of hammer most suited was the double-acting type, embodying the special feature of light blows with high frequency. While there were so many sections to choose from, each particular type and size of section required the right size and type of hammer. At the present day there was available a complete range of sizes of double-acting pile hammers to suit every steel piling section in use.

Practically all modern steam piling hammers had evolved from the original idea of James Nasmyth, who first employed the modified smith hammer for pile driving at Devonport in 1845, but we had had to look to firms in the U.S.A. for modern improvements. The driving of piles in certain sandy districts could be materially assisted by water jetting. A water-jetting plant might be portable and self contained, independent of the pile-driving plant, or the pump might be mounted on the base of the pile-driving frame itself.

In the second class of piling to be considered, namely, independent bearing piles, these might be of timber, steel, pre-cast reinforced concrete, or cast in-place concrete. It was the cast in-place concrete pile that would be dealt with in detail, as practically all will be familiar with the first three. While the pre-cast concrete pile would find many advocates, and it would probably continue for many years in use for jetties, piers, and wharves, the type was finding more and more competition from the cast in-place, especially for building foundations, where the cast in-place concrete pile had many distinct advantages; for instance, the concrete was not subjected to any drastic driving operation, the mixture of the concrete needed not to be so rich, and would not require so much care in mixing; steel reinforcement need not necessarily be carried throughout the length of the pile, only for a small distance from the top, so as to connect up to the capping or slabbing. No space was required to lay out moulds, the piles being made in the ground, economically to the correct lengths. Piling could be proceeded with immediately, no time being lost in waiting for the concrete to set. In order, however to reap the full advantages of the cast in-place concrete pile, it was essential that the finished pile should be without voids, and should entirely fill the hole in the ground, and it would be for the engineer to consider carefully the various systems which were available to him before making a decision.

Cast *in situ* systems which have been employed from time to time in the past might be classified as follows :—(a) That in which a weighted metal cylinder is sunk into the ground while grabbing out the enclosed material; filling with concrete in layers rammed in turn while extracting the cylinder with jacks as in the Strauss system. Under this heading may be classed the more modern method of driving a steel tube, ejecting the material enclosed by compressed air, then filling with concrete, leaving the tube permanently in the ground. (b) Those in which a cylindrical or tapered hole is punched in the ground and concrete poured in. In the Compressol system the concrete is deposited in layers, each being rammed in turn. In the Raymond system a metal sheathing is wrapped around a tapered mandril which is driven into the ground, then withdrawn, leaving the sheathing behind as a lining for the hole so formed. (c) Systems which are designed to form an enlarged bulb at the foot, which is either attainable by special ramming or by using an explosive or compressed air, made to operate on a quantity of concrete at the bottom of a driven tube, which is afterwards withdrawn, systems following this method being the Hunley Abbot and the Wolfholts. (d) Those which employ a steel tube with shoe spigotted at the bottom end; driving into the ground; filling with concrete; and extracting by a direct pull leaving the shoe behind, and in some cases using a ram for consolidating the concrete during the extraction of the tube, the best known of this class being the Simplex.

RHEIMS CATHEDRAL

SIR BANISTER FLETCHER, F.S.A., F.R.I.B.A., in his lecture, devoted entirely to Rheims Cathedral, on December 7, at the Central School of Arts and Crafts, showed that all the principles of Gothic architecture, at the period of its greatest perfection, were exemplified in the construction and decoration of this magnificent cathedral. Great among the many great cathedrals which covered France, and third among them in actual size, the cathedral overlooked the town, which took its name from the Remi, who submitted to the Roman legions. Then, as now, in the midst of a fertile vine-growing plain, the city was on a great highway of war, as it had been, also, in the track of Christian missionaries by way of the Roman roads.

The first church by S. Nicaise was probably of timber, and here King Clovis was baptised The second church on the site was destroyed at the beginning of the thirteenth century, just when the time was ripe for building a cathedral in the free Gothic style, which was so well suited to French freedom in ideas. Archbishop, architect, masons, and citizens set to work to rebuild their old cathedral, which had already attained such a proud position as the coronation church of France; and the church they erected proved to be the greatest triumph of Gothic art in France, beautiful both within and without. The cathedral soared into the air, borne aloft by panelled buttress with canopied pinnacle and flying arch; while sculptured figures of kings, saints, and heroes gave the Bible story without, as the glowing window-pictures in stained glass did within, till figures and pictures alike were shattered by German shells, but now the fabric was almost restored to its former splendour.

MEDIÆVAL GLASS PAINTING

MR. JOHN A. KNOWLES, F.S.A., delivered a lecture on this subject at the Victoria and Albert Museum recently. He said that nowadays, when one entered a cathedral such as York, one obtained quite an erroneous impression of what it must have looked like in the Middle Ages. Instead of brilliantly coloured glass set in grey stone, formerly the whole of the walls were painted and decorated, and when, as sometimes was the case, the mullions were gilded, the effect must have been gorgeous indeed. One got a good idea of what the rich-coloured wall decoration in a mediæval cathedral looked like at Amiens, for during the war the French Government removed many of the monuments built against the walls in the sixteenth century, thus disclosing the original wall decoration as fresh as the day when it was done. In the Middle Ages, therefore, stained glass only formed a part of the general scheme of embellishment, mediæval architects seemed to have planned their buildings with a view to getting the utmost amount of effect from it. This was evident both at York and Gloucester, which two cathedrals seemed always to have been rivals as to which had the larger east window; at York the roof of the Ladye Chapel had been sloped up towards the east so as to get in the highest possible window, whilst at Gloucester the sides of the last bay in the choir had been splayed outwards so as to accommodate a window wider than the central aisle itself.

In England, during the Middle Ages, everything, from building the church to painting the stained-glass windows or illuminating the service books, was done by contract. In order to encourage the craftsman to do his best, it was usual to insert a clause promising a sum of money as a reward when the work was completed to the satisfaction of the ecclesiastical authorities. Thus, in the agreement made in 1406 with John Thornton to design the great east window, the Dean and Chapter of York promised him ten pounds (no small sum in those days) "for his reward." But cathedral authorities in France, when dealing with private firms, had a much more subtle method of protecting themselves. They ranged on their side one who was up to all the tricks of the trade, and who was, moreover, in a unique position to find out whether the work was being scamped—viz., the glass-painter's wife. They secured this powerful ally by the promise of the price of a new hat when the work was done.

We were often inclined to look upon the treatment of Biblical and other scenes in ancient windows as naïve, even childish, in their artlessness; but this, in the opinion of the lecturer, was not the correct view. Certainly many of them were ingenuous to the point of being almost funny; we saw, for example, a king and queen in bed, with their crowns hanging on two pegs over the In a Birth of the Virgin in Le Museum, St. Anne lay in bed wit nimbus, or halo, between her head ar pillow, whilst two angels rocked a cradl taining the infant Virgin, who was t so that if they rocked too violently she not roll out. At St. Peter Mancroft, No in a Nativity, a woman attendant "airing" the infant's clothes before Again, we had the Prodigal Son in sixteenth-century costume playing gammon in a public-house—the Moon"—the sign hanging outside bein through the open door. Or St. Will horseback crossing Ouse bridge, which its size, appeared to be not more tha long. But there could be little doub the mediæval artist was aware of seve not all, of these mistakes, and that he a many of them deliberately in order to a picture the subject of which could once recognised by even the most ig observer.

There was probably no mediæval about which so many particulars were as that of the glass-painters. At Yo names of over a hundred of them w corded, and of most of them many showing what manner of men they we how they conducted their businesses available.

EXPERIMENT IN HOU BUILDING

AN experiment in building a ho ground that was sinking owing to workings underneath has been recentl pleted at Feldhouses, between Glasgo Edinburgh. In this mining town the was on the point of collapse. It had propped up with heavy wooden bean the walls split in a way that made gerous to continue to live there. But were seams of coal under the ground district, and any ordinary brick or sto threatened with a similar fate.

In order to meet the danger, Messrs. more, of Glasgow, were asked to sup Atholl steel house on a platform tha be jacked up in case of subsidence. The ing, on its full perimeter, has a 7 in. b by 17.5 lb. per ft. channel as a base which is securely fixed by means of brackets of 3½ in. by 3 in. by ¼ in. b long to the T-stanchions. The joi ground floor are securely fitted into of channel, and into bosom of 6 in. b by 12 in. I intermediate beams, whi horizontal throughout the whole length building, spaced between front and bac The wall plating laps on to the cham is bolted there. On the line of mutua a series of 4¾ in. by 1¾ in. by 6½ lb. I are inserted between 7 in. by 3 in. c and 6 in. by 3 in. H beams respe

The erection is set on and rag through 12 in. by 12 in. by 12 in. c piers, which in turn rest on a 24 in. b by 6 in. thick reinforced concrete fou set to permit the lifting jacks being i under bearer beams. The rag-bolts 5 in. screwed margin for adjustment.

The chimney stalks to bedrooms an rooms are carried on a reinforced c platt supported in main 7 in. by channel and 6 in. by 3 in. by 12 lb. beams in bedrooms, and wholly on 6 3 in. by 12 lb. R.S.H. beams in the living rooms. The whole structure— front channel to first intermediate bea intermediate to second intermedia second intermediate to back cha securely bound by means of ⅜ in. d tie rods with nuts and jamb nuts. event of subsidence taking place, jac be inserted under beams, the reinforc crete blocks being extended for seati jacks at these points, thus making p for the levelling up of the founda raising or lowering, as may be desired

Question of Ownership.

EPLY TO "R. R.," DECEMBER 9.]

—There is no doubt that in works of truction and repair it is customary for ntractor to remove from the premises als, fittings, etc., no longer required; rovision is usually made in the con- to this end. If, however, no provision e, unless it can be inferred that there mplied agreement that such items may moved by the contractor, then, without they still remain the property of the er; and he could, in this instance, their return or their value. Though the employer is not entitled to deduct lue of the articles from what is due contractor, yet, nevertheless, this he the best and less costly means of ent where they are not returned.

C.

Method of Construction.

answer to "Inquirer" on this sub- as been forwarded by post.

Water-Closet Connections.

EPLY TO "QUERY," DECEMBER 9.]

—The connection between the outlet of er-closet and a drain in earthenware pipes should present no difficulty. It should be executed in neat cement exactly as between one drain-pipe and another. Although it makes it practically impossible to take out the pan at any time without fracturing both it and the drain-pipe, it is a wise precaution to form the cement joint right over the collar and wiped neatly round. The likelihood of the pan having to be removed is so remote as to be worth ignoring in this case.

The joint between the trap and the lead elbow is best made with a brass sleeve, to which a cement joint between it and the earthenware pan, and a lead or solder joint between it and the lead pipe, can equally apply. The old-fashioned "bound-up" joint is not to be recommended.

SANITARY.

Efflorescence in Brickwork.

[REPLY TO "H," DECEMBER 9.]

SIR,—The efflorescence of brickwork is due to some component in the brick clay, of a salty nature. Until it has worked out it will continue to occur, and it remains to hasten the process. Keep fires alight as long as possible, and frequently brush off the white deposit as it appears, and time will then complete the cure. The great thing is not to allow the efflorescence to become re-absorbed into the brickwork with changes in climatic conditions.

PATIENCE.

Method of Construction.

[REPLY TO "INQUIRER," DECEMBER 9.]

SIR,—Carry the ceiling rafters over and secure to wall plate, and fix another plate thereon about one foot out from the first plate. To this, birdsmouth the rafters on, and extend the overhang by means of sprockets. The reason for not putting the second plate out the full projection is that at this leverage the "spring" is sufficient to make it difficult to nail the second plate to the free ends of the ceiling joists, whereas at one foot it is sufficiently solid.

X. X. X.

Painting.

[REPLY TO "AMATEUR," DECEMBER 9.]

SIR,—Good paint should never be removed unless it is perished or blistered, or there is some fault apparent in the undercoats. After well rubbing down, three good coats should be sufficient to cover a dark colour.

PAINT.

Condensation on Shop Windows.

SIR,—I should be glad if some reader could suggest the best means of preventing steam from forming on the inside of shop windows during cold weather. Following are a few details of a case in point:—

The area of the shop is about 1,200 sq. ft.; the window on one side of the doorway is open to the shop and on the other enclosed with glass doors. The show board is about 18 in. above the floor. The shop is lit by gas and the windows by electricity.

TROUBLED.

WEEK IN PARLIAMENT

WESTMINSTER, Wednesday.

Houses Built.

Sir Kingsley Wood informed Mr. Potts that the number of houses erected from the Armistice to March, 1927, was approximately 866,500.

A Torquay Petition.

Mr. C. Williams asked the Minister of Health if he would state the grounds of the refusal of the petition sent to him by 200 ratepayers and subsidy-house owners of Torquay, asking him to have an inquiry made into their position?

Mr. Chamberlain said that the petition related to certain defects which became evident during the progress of the local authority's subsidy scheme. He communicated with the Council on this matter, and steps were taken to improve the administration as regards future subsidies, and the scheme had now been brought to an end. He had given the matter his careful consideration, and was satisfied that there would be no advantage, either to the public generally or to the purchasers of subsidy houses in particular, in now holding an inquiry.

Problem of Slum Areas.

Mr. Naylor asked the Minister of Health whether he had reached any decision as to the best means for dealing with the problem of slum areas in Southwark and other London boroughs, and the provision of suitable accommodation in the same neighbourhoods for those families to be displaced by slum clearances?

Mr Chamberlain replied that under the Housing Act, 1925, in the Metropolis it was the duty of the London County Council and the Metropolitan Borough Councils to deal with slum areas in accordance with the provisions of Part II. of that Act. A number of schemes which had been confirmed by his Department had either been carried out or were in course of execution, and in confirming such schemes full consideration was given to the question of the extent to which rehousing accommodation should be provided on the cleared site or in the immediate neighbourhood.

Saving by the Reduced Subsidy.

Replying to Mr. Harmsworth, Mr. Chamberlain said that the capital value of the reduction of the annual Exchequer subsidy for houses completed after October 1 amounted to £25. The actual saving to the Exchequer would depend on the number of houses built while the reduced subsidy was operating.

Stonework at Westminster.

In answer to Mr. Hardie, Sir V. Henderson, for the First Commissioner of Works, said that no stone had yet been selected for repairing the stonework of the Houses of Parliament, and it had not, therefore, been possible to make any progress with the work of repair.

Mr. Hardie then inquired whether, if stone could not be found from the ground, it would not be wiser to try some synthetic stone, if for no other reason than to prove whether it would offer more resistance to the London atmosphere.

Sir V. Henderson replied that the Office of Works had selected Stancliffe stone as being the most suitable, but that stone had been referred to the Fine Arts Commission. At the same time, it was necessary to refer the question to the Department of Scientific and Industrial Research to find out whether they considered that the mating of the two stones would have any unfortunate effect. When their replies had been received it would be possible for the Office of Works to make further progress. He would have the question of the use of synthetic stone considered.

Houses Authorised.

Mr. Chamberlain stated that during the months of October and November this year 10,297 houses were authorised to be built by local authorities in connection with subsidy schemes under the Housing Acts, and contracts were let during the same period for 8,368 houses. The corresponding figures for the months of October and November, 1926, were 9,278 and 16,544 respectively.

Cost of the Subsidy.

Mr. Chamberlain: The capitalised value of the Exchequer subsidies payable in respect of the houses in England and Wales completed before October 1, 1927, under the Acts of 1923 and 1924, was approximately £48,000,000.

Houses Demolished.

Mr. T. Thomson asked how many houses had been demolished during the past 12 months under the slum clearance schemes under the Housing Acts.

Sir K. Wood said that statistics as to demolitions in connection with slum schemes did not distinguish between houses and other buildings, but during the 12 months ended in September last, 1,383 properties included in such schemes had been demolished.

THE BUILDING TRADE

LONDON MASTER BUILDERS' ASSOCIATION ANNUAL DINNER

THE annual dinner of this Association was held on Wednesday, December 7, in the Edward VII. Rooms, Hotel Victoria, when the President, Mr. A. H. Adamson, F.I.O.B., occupied the chair. A company numbering more than 330 included the following: Viscount Peel (First Commissioner of Works); Viscount Burnham; Sir J. Walker Smith (Director N.F.B.T.E.); Sir Walter Lawrence (PP.L.M.B.A.); and Messrs. Ralph J. Holliday, J. M. Gatti (Chairman, L.C.C.), Percy Thomas, V.P.R.I.B.A., Stuart Bevan, K.C., E. W. King (President, National Federation of Building Trades Employers), Fred. Thorne, V.P.N.F.B.T.E., G. Topham Forrest (Supt. Architect, L.C.C.), W. A. Jowitt, K.C., S. Guy Sapcote (President, Institute of Builders), E. C. Desch, F.S.I., A. B. Falkner (Immediate Past President, L.M.B.A.), Charles Gane (President, Timber Trades Federation of the U.K.), G. Mackenzie Trench, F.R.I.B.A., G. A. Coulson (President, National Association of Shopfitters), Alfred Taylor (President, London Association of Master Stonemasons), H. D. Searles-Wood, F.R.I.B.A., J. E. Drower, F.S.I., W. F. Gibson (President, South Wales F.B.T.E.), C. M. Smeaton (President, Associated Master Plumbers and Domestic Engineers), W. A. Forsyth, F.R.I.B.A., Chas. Baker, E. J. C. Savory, L. A. J. Francis, F.S.I., G. A. G. Robertson, F. J. Gaver (PP.L.M.B.A.), W. T. Plume, Hon.A.R.I.B.A., J. Murrey (Secretary, National Federation of Building Trades Operatives), A. G. White (Secretary, National Federation of Building Trades Employers), C. H. Kearley, P. J. Spencer (Secretary, Institute of Builders), J. Dudley Daymond, Albert E. Symes (President, East Suburban Branch, L.M.B.A.), T. P. Bennett, F.R.I.B.A., Heaton Comyn, F.R.I.B.A., Cecil G. Hare, C. J. Bennett, C. Ernest Elcock, F.R.I.B.A., Austin Blomfield, A.R.I.B.A., E. C. P. Monson, F.R.I.B.A., C. Lovett Gill, F.R.I.B.A., Ewart G. Culpin, L.C.C., C. W. Buchanan, C. W. Long, F.R.I.B.A., H. G. Crothall, F.R.I.B.A., G. H. Parker (Vice-President, L.M.B.A.), P. F. Gleed, P. J. Westwood, F.R.I.B.A., S. G. Jeeves, F.R.I.B.A., Ben Carter, A. D. S. Rice, Ernest J. Brown (Director and Past President, L.M.B.A.), F. W. Loasby, A. Strachan Bennion, F.S.I., E. J. Rimmer, Alec. Smithers, F.R.I.B.A., R. L. Roberts (V.-P., L.M.B.A.), G. J. Aldous, Detmar Blow, F.R.I.B.A., Septimus Warwick, F.R.I.B.A., T. M. Wilson, F.R.I.B.A., A. B. H. Colls (Hon. Treasurer, L.M.B.A.), Henry T. Holloway (P.-P., L.M.B.A.), J. F. Greenwood, H. W. Parnacott, A.R.I.B.A., Stanley Hamp, F.R.I.B.A., N. C. Macnamara, O. H. Collins, F.R.I.B.A., Edmund Wimperis, F.R.I.B.A., Owen Campbell Jones, F.R.I.B.A., Thos. Wallis, F.R.I.B.A., Frank J. Walton (President, Builders' Benevolent Institution, P.-P., L.M.B.A.), J. H. Barns, D'Arcy Braddell, F.R.I.B.A., Humphrey Deane, Lionel U. Grace, F.R.I.B.A., Oswald P. Milne, F.R.I.B.A., W. J. Rudderham (Secretary, L.M.B.A.), Percy C. Culver, Robert G. Muir, F.R.I.B.A., A. D. Edmonds (President, London Builders' Foremen's Association), D. Palmer Jones, W. Soole (President, Richmond Branch, L.M.B.A.), H. W. Wills, F.R.I.B.A., and Thos. S. Tait, F.R.I.B.A.

The loyal toasts having been honoured,

Mr. R. L. Roberts, V.P.L.M.B.A., proposing the toast of "The Houses of Parliament," said that among their distinguished guests they welcomed Lord Peel, who, as First Commissioner of Works, might be described as the premier clerk of works of the United Kingdom. Lord Peel had always been willing to consider the interests of the building trade, and listened readily to any representations made to him. Lord Burnham, whom they also had with them, as Chairman of the Building Trades Employment Committee took a great interest in the industrial side of their business. He (the speaker) trusted that in the near future the industry would claim less and less the attention of Parliament. Most builders hoped to see the speedy disappearance of the housing subsidy. The subsidy had been a temporary expedient, justifiable under the circumstances, but the need for it was passing away. Housing arrears were being overtaken, and it was only fair to recognise that the Government's success in tackling the problem would have been impossible but for the loyal co-operation of employers and employed in the building industry. The building trade in its industrial relations was not much troubled by Parliament. In the building trade there had been a steady growth in the settlement of disputes by voluntary agreement. Happily both employers and employed were realising that their future rested in their own hands, and that they must not expect the Government to solve problems which rightly belonged to industry alone. In that respect the building trade set an example to the other trades of the country.

Lord Peel, responding, said the Department which he represented was responsible for some 6,000 buildings, so perhaps Mr. Roberts's description of him was justified. Having complimented the trade upon the excellence of its internal relations and upon the loyalty with which agreements between employers and employed were observed, the speaker turned to the question of the refacing of the Houses of Parliament, on which the L.M.B.A. had given much appreciated advice, and said that no final decision had yet been reached with regard to the stone to be employed. Stancliffe sandstone had been suggested, and the matter was now under the consideration of the Royal Fine Arts Commission. There was some conflict of opinion even among the experts. Some suggested that Portland stone should be used for the refacing of the whole building, but the question of expense had to be considered. They would, however, most carefully consider the advice of those most competent to give it. The L.M.B.A., he continued, really was London, because they and their predecessors had created it. They were also largely the creators of the character of Londoners, because it was a scientific fact that the colour, decoration, and the shape of buildings in which people worked largely controlled the amount and quality of their work. He wondered what would have been the democratic expression of our Parliamentary proceedings if they had been carried on in a Classical and not in a Gothic building.

Lord Burnham, proposing the toast of "The London Master Builders' Association," said it was six years since he took the chair of the Building Trades Employment Committee, which secured to them an ample supply of skilled craftsmen. He was, of course, always able to lean on the broad shoulders of Mr. Ernest Brown. The building trade remained to him a mystery as well as a craft. It was the most prosperous industry in the whole country, and he should have thought that, protected as they were, all was bound to be well. But he was told it was not so; no trade was being worked with so narrow a margin of profit. That was a rare tribute to their public spirit. As building was a key industry of our country and Empire we looked to builders to maintain the high fame and name of our country in the realisation of the ideals of art in marble and in stone. He understood that there had never been a greater triumph than that which was taking place at the Bank of England, though some wond whether it would not have been pos to save more of the old work. Bank was built over the Wall Brook, as piles had been driven down in the days, little could have been found reward the zeal of the archæologist c increase the value of our London collect He had seen in South Africa the achiever of Sir Herbert Baker, who had transfo the tin shelters of townships that ha the character of an American mining into the becoming and congenial styl the old Dutch Colonies. He (the spe wished we had more men of Sir He Baker's genius at work in London an suburbs to-day.

At the conclusion of Lord Burnh speech, the President's health was ent astically toasted with musical honours

The President, in response, said he f a great honour to respond to that toast. Burnham had referred to the "myst of the building trade. It was only a my because those who were most acquainted it could not make out how each one of earned his living. As to the Houses of liament, they were absolutely agreed there was no necessity to go outside country for a stone for repairs. held that to carry out the whole of the l ing with Portland stone would cost less to use Stancliffe stone, because the wea ing qualities of the latter, particularly colour, were less dependable.

Referring to the work of the past year speaker said their negotiations with the c tives had been carried on in a spi good-will and co-operation, with the that they had recently signed a new wo rules agreement which would bring har in the London area. He regretted tha masons, bricklayers, and plasterers wer parties to it, but as the first two had de to rejoin their national organisation, he l soon to see an agreement with them parallel lines. The question of the plas was a delicate one, but he thought time solve that problem too. He was glad had reached agreement with their oper on the question of apprenticeship. lads who were presenting themselves f for apprenticeship to the building were the best type of lad they had had in the industry, a fact he consi due very largely to the sound secon education they received and the encou ment given them to attend evening cl No fewer than 750 apprentices had been into the trade in London in connection the great housing schemes, but empl must remember that housing was no best school for high-class craftsmanship he urged the members, in the interes the industry's future, to employ as ma these lads as they could. They had re had the opportunity of welcoming Mr. per, President of the Royal Institute of B Architects, at one of their Council mee when he presented the prizes to the mas the apprentices' competition arrange master mason members. They hoped able to arrange competitions among the crafts. Negotiations on a most fri footing were being carried on with R.I.B.A. on the Form of Contract. concern, the speaker continued, had felt during the past year over the co of buildings and the subsidence of Very grave risks, he thought, were t taking the foundations of buildings do low. In the "earth delver" there w much risk as in the "skyscraper."

Having referred to the loss which Association had sustained by the dea Mr. Roland B. Chessum and Mr. Minter, the President turned to the and said he had heard it said that the ing industry was now at the stage re by the engineering industry when it g

Association had discovered that their
cost for tendering was £25,000—about
cent. of the cost of the work they
y performed. Further, they reckoned
or the whole of their membership there
sum of close on £2,000,000 outstanding
ention money. What joy there would
they could release only half that sum.
not trust the builders more? There
as many honest men in the building
ry as there were in any other trade.
not some scheme be devised to get
from the wasteful system of tendering?
ggested a round-table conference of
cts, builders, surveyors and operatives
view to discovering a way of bringing
the cost of building so as to absorb
bour that must shortly be released
housing. With regard to building in
.S.A., he was told that the Americans
their buildings to last for twenty-five
ty years only. It was impossible for
visualise buildings erected for such a
period. On the question of speed of
action, members of the L.M.B.A. had
to the United States to study their
ds, and they assured him that, given
ame conditions, we could build as
ly and as well as American or any
contractors on the face of the earth.
G. H. Parker, proposing the toast of
Guests," mentioned that for the first
in the Association's history they had
hem a representative of the operatives
Murrey, Secretary of the London Build-
rades Operatives.
J. M. Gatti, Chairman of the L.C.C.,
ponse, said the Council had been good
s to the industry, because since 1918
ad spent £17,500,000 in building houses,
ad lent £2,750,000 to other people to
them to buy or build their own houses.
standard had been, as far as possible,
erely to provide houses, but homes, and
did look to the master builders to
hem to meet what was absolutely Lon-
greatest need—decent houses for people
in. From the municipal point of view
ld that until people had decent houses
e rest of the work was being undone as soon as it was attempted. We spent £12,000,000 a year on education, teaching children to be cleaner in mind and body, but what was the use of it if when the child left school he went back to conditions that were a disgrace to civilisation?

Mr. Percy Thomas, V.-P.R.I.B.A., in response, said he thought that difficulties could be considerably lessened by a better feeling between architects and builders. In the Provinces they had promoted meetings between the local building associations and architects. Although they could not solve all the difficulties that arose, much good had come from those meetings.

Mr. J. Murrey, Secretary of the National Federation of Building Trades Operatives, called upon for a speech, said his presence there was an innovation and he appreciated the honour very highly. The great duty imposed on all organisations connected with the building industry was to avoid quarrelling over petty matters, and to get down to the concrete fact of social service to the community. In America, it was proved that machinery had reduced the cost of building, but he did not wish to see building operatives in this country reduced to machine-minders; there was danger in cutting across the ideals of the operative. If the old-time relationship between employer and employee could be brought back he thought it would ensure a great improvement. The general foreman to-day had largely taken the place occupied by the employer in the past. His Federation was entirely in favour of industrial peace—though not at any price. The best place to deal with problems as they arose was at the conference table.

THE RENT RESTRICTION ACTS.

A MEMORANDUM has recently been prepared by the Chairman of the Unionist Housing Committee, Lt.-Col. Fremantle, M.P. for St. Albans, that contains a number of important suggestions relating to the future of Rent Restrictions. He draws the attention of his colleagues to the fact that the first Rent Restriction Act was passed in 1915, admittedly as an emergency measure, and that the date fixed for its conclusion was six months after the "termination of the war." Nevertheless, on November 17 last it was further prolonged for one year to Christmas Day, 1928, and in Scotland to May 28, 1929, by its inclusion in the Expiring Laws Continuance Bill.

Col. Fremantle was a member of the Departmental Committee appointed to advise on what steps should be taken to continue or amend the Act. In a reservation to the Report he proposed to allow for the very different circumstances of different areas, and to retain further control for one year in each case, and for so much longer in any area of a county or county borough as might be resolved, year by year, by its Council. He now suggests that a possible modification of existing legislation might take the form of decontrol in three stages in turn, and of giving a local option to county boroughs, and perhaps other areas, to continue the protection of the £26 house year by year.

In his views the Acts certainly protect tenants, and "in very many cases such protection is necessary in hard times, when the houseowner, like anyone else, wishes to make the most of his assets. But these Acts have a very reverse effect on the sub-tenant, who in large cities form a far larger part of the population. These unfortunate people are seldom aware of the relief given them under the Acts, and if they were, dare not go to Court for the purpose; while the tenants, trading on their own immunity, and the demand for rooms at almost any price, are too often gaining an unfair advantage at the expense both of the owner and of the sub-tenants. On the whole, the Acts are more of a hardship than a boon to the very poor.

"The Acts, moreover, give such security that a single obstinate tenant may unreasonably hold up the re-development of areas as building leases fall in; while their effect on management of house property is often deplorable. It is in the light of these experiences, rather than that of their obvious intention, that the closest attention should now be paid to the operation of the Acts; and it would seem not unlikely that there will be a growing demand from all concerned for their lapse within a year or two, with local exceptions, when the safeguards, provided in Part 2 of the 1923 Act for the following five years, come into play."

VALUATIONS UNDER THE NEW RATING ACT.

THE first lecture of the session at the College of Estate Management, 35, Lincoln's Inn-fields, W.C.2, was delivered recently by Mr. C. Gerald Eve, F.S.I., who dealt with some points of practice in valuing under the Rating and Valuation Act, 1925. The points to be urged, he said, in making an objection to an assessment might be set out as follows:—That the values—gross, net, and rating—were excessive and incorrect; that they were unfair by comparison with other properties of the same class and of other classes; that the deductions from gross and from net were insufficient; that the values had not been ascertained by an independent valuation; that too much machinery and plant had been rated; and, finally, that the assessment was otherwise incorrect. It was the duty of the surveyor, on behalf of his client, to see that his counsel at sessions was left with a wide field from which to select. In making comparisons he should not suggest that the other property was rated too low, but that it was correctly rated, whereas his own property was rated too high. In appearing before the valuation committee the surveyor should make it plain that he relied upon all the objections set out, even though he chose to talk only about one or two of them; otherwise it might be said that he had abandoned some of the heads of the objections. With regard to woodlands, the lecturer claimed that these came under the Second Schedule of the Act, Part 1, paragraph 7, as "land (other than agriculture land) without buildings," on which the amount of deduction was equal to 5 per cent. of the gross value. The gross value was that which was known as "prairie value," and from this 5 per cent. was to be deducted.

The term "rateable value" now meant something different from that which had been customary. It meant the reduced figure on which rates were actually paid. Coming to the different taxes, he said that the land tax was a tax on the owner, and the drainage rate might be in law borne by the landlord or by the tenant, local drainage statutes would set out which. As for sporting rights, it was clear that if the landlord reserved the shooting and did not let, the rateable value of the land was increased by the value of the sporting. Obviously, the valuation of the buildings could not be increased, because nobody shot over the buildings, yet it had been laid down that, until the Courts decided otherwise, the shooting should be put on the buildings. This was wrong, in his opinion. With regard to machinery and plant, he pointed out that the Third Schedule of the Act went by the board; reference must be made to what was irreverently termed the "washing bill" in the shape of the detailed list issued under authority as Statutory Rules and Orders, 1927, No. 480. Mr. Eve, for the benefit of the students, carried through the model valuation for rating purposes of a small farm.

Irish Slate Quarries to Reopen.

We learn that in Ahenny and Newtown districts, Carrick-on-Suir, Tipperary, there is a prospect of an early opening of the local slate quarries by the company that recently acquired them. About 60 persons will find employment there as a beginning.

POINTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—VIII.

WE have shown in our last article that except in the case of tenancies on sufferance and at will, there is a right to assign, therefore it is necessary where it is desired to restrict that right to frame a covenant which will attain that object and this requires considerable care.

Covenants not to assign or sublet the premises or not so to do without consent run with the land, even when assigns are not expressly mentioned, Goldstein v. Sanders (1915, 1 Ch. 549); R. Stephenson & Co., Ltd., Poole v. The Company (1915, 1 Ch. 802), and in this latter case it was held that the inclusion of the words "and assigns" in connection with the lessors and the exclusion of those words when the lessees were mentioned, did not negative the general presumption that such covenants run with the land.

Where in the lease there is a power of re-entry for breach of covenant, there was for some time doubt whether if that power was given for breach of covenants to be performed that would include a negative covenant not to assign or underlet, etc., but this doubt was disposed of by the Court of Appeal in Harman v. Ainslie (1904, 1 K.B. 698; *The Builder*, May 14, 1904). In that case a lease containing a most exhaustive covenant against assigning, etc., had been assigned to and become vested in the defendant, whilst the reversion in the lease had been purchased by the plaintiff, and the lease contained a power of re-entry "if the said lessee shall commit any breach of the covenants hereinbefore contained and on his part to be performed." The defendant had underlet the premises without having applied for or obtained consent, and in an action for forfeiture it was contended that the word "performed" was inapplicable to negative covenants of this kind, but the Court of Appeal held that the word, unless a contrary intention is expressed in the document as a whole, embraces the fulfilment of the obligation or duty undertaken, whether that is one of performance or non-performance.

As a rule, the prohibition against assigning, underletting, etc., and the provision that consent shall not be unreasonably withheld are contained in one and the same covenant, but sometimes the latter provision is contained in an express covenant by the lessor. This was the case in Ideal Films Renting Co. v. Nielson (1921, 1 Ch. 375; *The Builder*, March 25, 1921), where the effect of the two covenants was explained. Mr. Justice Eve found that it was established beyond controversy that if the form of the covenant was merely qualified by a provision that the consent of the lessor was not unreasonably to be withheld, that did not amount to a covenant by the lessor that he would not unreasonably withhold **his consent, and in the** absence of an express covenant on his part no action would lie against him for damages for unreasonably withholding his consent. In such circumstances the only remedy of the lessee was that he could assign without consent. But where as here there were two covenants, the one by the lessee and the other by the lessor, the lessee, far from being in a worse position, **had a further remedy** against the lessor for damages. We shall refer again to this case when we come to consider the grounds for reasonable refusal. But an underlessee for a period less than the whole term is not an assignee of his lessor (the original lessee) so as to be entitled to the benefit of a positive covenant entered into with the latter, "his executors, administrators and assigns," by the ground landlord in the original lease (South of England Dairies v. Baker, 1906, 2 Ch. 631)

Before considering the cases on consent to assignments, etc., we must refer to a change in the law brought about by the Law of Property Act, 1925, as it will have a bearing upon some of the decisions given before that Act came into operation on January 1, 1926.

Under the old law there were two Acts bearing upon this question of covenants in leases. Section 14 (subsection 1) of the Conveyancing Act, 1881, provided:—"A right of re-entry or forfeiture under any proviso or stipulation in a lease for a breach of any covenant or condition in the lease shall not be enforceable by action or otherwise unless and until the lessor serves on the lessee a notice specifying the particular breach complained of and, if the breach is capable of remedy, requiring the lessee to remedy the breach, and, in any case requiring the lessee to make compensation in money for the breach, and the lessee fails within a reasonable time thereafter to remedy the breach, if it is capable of remedy, and to make reasonable compensation in money to the satisfaction of the lessor for the breach." Then by subsection (2), where a lessor is proceeding by action or otherwise to enforce a right of re-entry or forfeiture, there is power in the Court to grant relief, but by subsection (6) it is provided: "This section does not extend (1) to a covenant or condition against the assigning under-letting parting with the possession or disposing of the land leased . . ."

Subsections (1) and (2) of the above Act are reproduced verbatim in section 146, subsections (1) and (2) of the Law of Property Act, 1925, but there is a material alteration of the law as regards subsection (6) of the Conveyancing Act, 1881, as section 146, subsection (8) of the Law of Property Act, 1925, now provides: "This section does not extend to a covenant or condition against assigning underletting parting with the possession or disposing of the land leased where the breach occurred before the commencement of this Act." Thus it will be seen that the old law will apply until January 1, 1926, but where breaches occur after that date then breaches of these covenants will be placed upon the same footing as breaches of other covenants and notice of the breach will be necessary and relief will be given as under section 14 of the Conveyancing Act of 1881, now represented by section 146 of the Law of Property Act, 1925.

The second statute we referred to as bearing on these covenants was the Conveyancing Act, 1892, which by section 3 provided "In all leases containing a covenant condition or agreement against assigning underletting or parting with the possession or disposing of the land or property leased without license of consent, such covenant condition or agreement shall, unless the lease contains an express condition to the contrary, be deemed to be subject to a proviso to the effect that no fine or sum of money in the nature of a fine shall be payable for or in respect of such license or consent, but this proviso shall not preclude the right to require the payment of a reasonable sum in respect of any legal or other expense incurred in relation to such license or consent." This section is reproduced practically verbatim in section 144 of the Law of Property Act, 1925.

We have already referred to clause 18 of the Landlord and Tenant No. 2 Bill (see our last article), which in sub-clause (1), if it becomes law, will imply in all covenants against assigning, etc., notwithstanding any provision to the contrary, a provision that consent shall not be unreasonably withheld with a special provision in the case of leases for more than 40 years made in consideration wholly or partially of the erection improvement, etc., of buildings, and it may be well here to mention that sub-clauses (2) and (3) deal with leases containing covenants against the making of improvements without consent, and cove against alteration in the user of pre and when this Bill becomes law clauses will have to be taken into cons tion by those affected by such cove Having now very briefly outlined so the provisions of the law relating to nants against assigning, etc., we will to the covenants and indicate how have been interpreted in recent decisi

The covenant can be framed in v terms, but to illustrate the cases w a covenant drawn in the most compr sive terms from Harman v. Ainsli *supra*), as it will illustrate the points in the cases.

"The said lessee shall not nor during the term hereby granted a underlet, or part with the possession said premises or any part thereof, or commit any act or thing where by means whereof the said premises o part thereof may be assigned or oth disposed of or the possession thereof with to any person or persons whom for the whole or part of the said without the consent in writing of th lessor first had and obtained for tha pose, such consent, however, not t unreasonably withheld in the case proposed assignment to a respectabl responsible person." It is unnecessa frame the covenant at such length that care must be taken in the term is illustrated by the recent case v. Beecham (1924, 1 K.B. 525; *The B* June 27, 1924). There are complic in that case, owing to various assign and mortgages, but for the presen point decided can be stated briefly. lease for 30 years, from March 25, there was a covenant that "The lessee not nor will during the last ten ye the term hereby granted assign o with this lease or the premises here mised or any part thereof withou license and consent in writing of first had or obtained." An assignee lease in 1921 had sublet two of the pal rooms on the ground floor of th mises for three years, with an opt the tenant of continuing the tenan successive periods of three years, s as the landlord or his assigns shou main lessee of the premises. No c had been obtained to this letting, a head lessor claimed possession for of the covenant, but the action The majority of the Court of Appea that a construction had been put up words "assign and part with" b old decisions, Doe v. Hogg (4 D. a 226) and Crusoe v. Bugby (1 Wm. 766), which had been acted upon too disturb, that construction being tha words in that connection mean the thing—that is, to part with entir completely—a parting with the pos apart from a mere change of occup which was the case here, and it was out that, if it is desired to provide the latter contingency, words must b which admit of no other meaning, instance, that the lessee shall not with the possession of the demise mises."

Lord Justice Scrutton based his ju on a different ground—that a partin possession of only a part of the pr did not fall within the exception p by section 14, subsection (6) of th veyancing Act, 1881, and therefore n the breach should have been given subsection (1), and in the absence notice the action must fail.

The majority of the Court expres opinion upon this point, and, as w show, this dictum of Lord Justice S has not been accepted in two later Abrahams v. MacFisheries Company 2 K.B. 18; *The Builder*, July 31 and Carrington Manufacturing Com Saldin (1925, 133 L.T. 452). We sha to these cases in our next article, a show the necessity of providing covenant against parts of premise assigned or underlet.

PLUMBING TRADES' APPRENTICESHIP SCHEME

R. W. D. CARÖE, F.R.I.B.A., the Presi- took the chair at the second annual ction of the Central Apprenticeship ncil for London, when Council, em- ers, and apprentices met together and t a very enjoyable and interesting even- at the Northern Polytechnic, Holloway- l, N. Among those present were rs. Hugh Davies (of the Board of Edu- on), Bertram Hellyer, Walter Scott, A. Martin, Councillor W. F. Thacker, rs. F. Kempster, W. H. Stitson, J. ns, C. M. Smeaton, A. Grant, C. E. inson, W. H. M. Smeaton, H. Blackman ton, Lachlan Macdonald, and Mr. John Hamlin, secretary. Over forty appren- s from the London district were also ent.

he President, in introducing the main ker, Councillor W. F. Thacker, said last year he had been privileged to be iding at the inaugural meeting of the don Council and the apprentices under scheme. He was glad to see that the s of the scheme were being fulfilled, a me which was a modern parallel to the guild system which had brought Eng- craftsmanship into a position un- lled in Europe. And so he would say he masters that they should encourage lads under their control, and would them to set aside every form of restriction the nonce. The building trade was now in etter position to-day than ever before. mbing apprentices should work hard to ease their own knowledge and position, hout forgetting for an instant the cause heir craft.

ouncillor Thacker then gave an address nasters and lads, in which he said that would like to congratulate London on ing set up the first council. He then rred to the fine pitch to which sanita- had reached two thousand years ago. remarked that from that time until reign of Edward III sanitary measures e non-existent and disease ravaged Eng- l, which went to prove the close tionship of good sanitation, good plumb- and good health. Sanitation had im- ved more in the last fifty or sixty years n it had in the last five hundred or six dred. To-day they had to maintain and olidate that advance by perpetuating the al obligation of the craft. Materials basic- were the same as five thousand years ago, they had been perfected to such an nt that plumbing work would last as as the building did. The Worshipful pany of Plumbers had been responsible the various organisations which were triving to improve their craft, and it was all those organisations to stand together. Institute of Plumbers had been working g the line of education towards advance- t in plumbing matters. The Association laster Plumbers had also lent great assist- . as had a number of individuals. The s of the apprenticeship scheme were :

) To procure a higher standard of iency in the plumbing trade.

2. To procure and encourage a better e of manner; and

3 To ensure, by examinations, that those practised the trade of plumbing should ompetent to do so.

hether or no those aims were to be ied out depended on four factors—the l council, the masters, the operatives, the apprentices. The council would to be patient, persuasive, and, lastly, most important, enthusiastic. The em- er would have to be loyal to the scheme carry out those things in the scheme were applicable to it. Regarding the atives, they had greater opportunities n anyone else to assist the apprentice his daily work. The operatives could e him keen and helpful, and go a long towards turning him out a good work- . They could teach him good manners and those of the trade customs that were worth learning and carrying out. Lastly, the apprentice should endeavour to co-operate towards obtaining efficiency, and should try to prove that this system of education was justifying itself. The success of the scheme was made or marred by the apprentice himself. Finally, he would say that there should be some means of differentiating between the men who were competent and those who were not. He would like them to look upon qualification for registration as the crowning point of their education.

Mr. Hugh Davies, of the Board of Education, in proposing a vote of thanks to Councillor Thacker, said that the apprentices had in their hands the future of the plumbing trade. He was glad beyond all measure to learn that the present-day tradition of plumbing was again to be linked up with the City and Guilds and that the trade was going to take a position in the future which, possibly, it had never occupied before.

Mr. L. Macdonald seconded, and informal discussion followed.

Plumbing Trades' National Apprenticeship Council.

A meeting of this Council was held at the offices of the Institute of Plumbers on December 8, when Mr. Ernest Lesser occupied the chair. The chairman expressed the Council's regret at the death of Mr. S. Sigsworth, formerly President of the Operatives' Association, who had always given his wholehearted support to the furtherance of the National Apprenticeship Scheme. It was resolved that a message of sympathy be sent to Mrs. Sigsworth.

Encouraging reports regarding the adoption and progress of the scheme were submitted from North-East Lancashire, South-East Lancashire and Manchester. In the latter town the Corporation had agreed that all plumbing lads in their employ should be placed under the Council's scheme of apprenticeship.

A report from the London Apprenticeship Committee was also submitted, and it was stated that steps were being taken to secure a larger measure of support from London employers. The position at Birmingham, Hull, and in the West Riding generally, was fully discussed, and certain action suggested.

The Chairman and Mr. Hugh Davies reported as to the proposed deputation to the Board of Education regarding the reinstatement of certain City and Guilds examinations for plumbing students. The draft of a letter to the President of the Board was read and approved, and it was agreed, Dr. Clay consenting, that he should act as the Council's spokesman when the deputation was received: such deputation to represent 11 different bodies interested in the plumbing trade.

In response to an inquiry made at the last meeting of the Council, the Chairman gave it as his considered opinion that an indenture whereby a son was apprenticed to his father was, in law, a perfectly good and valid instrument. He was of opinion, however, that, on practical grounds, it was not expedient to encourage such indentures. A discussion ensued on this statement, several members citing cases where difficulties had arisen owing to the ill-defined nature of the father's contractual relationship to his son. It was finally agreed that the subject should be placed on the agenda of the next meeting for further consideration.

The following were unanimously elected officers for 1928 :—Chairman, Mr. E. Lesser; Vice-Chairman, Mr. Thacker; Hon. Secretary and Treasurer, Dr. R. S. Clay. It was resolved that an effort be made to arrange for the next meeting of the Council in Birmingham on March 14.

NEW BUILDINGS IN LONDON

Battersea.—The L.C.C. have received an application from the governors of the Battersea Polytechnic for a loan towards the cost of extending the Polytechnic, Battersea Park-road, S.W., which is estimated at £15,000. Plans have been prepared by Messrs. J. Campbell Jones, Son & Smithers, 9, Dowgate-hill, Cannon-street, E.C.4.

Cheapside.—The old property at the corner of Cheapside and Old Gutter-lane, E.C.2, is to be pulled down and a modern office building erected by Messrs. Alfred Boys & Co., Staple House, Chancery-lane, W.C.2. Plans are being prepared by Messrs. F. Taperall & Haase, 5, Stratford-place, W.1.

East Ham.—Plans have been sanctioned for the carrying out of alterations and improvements to the premises at No. 50, High-street North, E. The architect is Mr. E. Cannell, 259, High Holborn, W.C.

Fenchurch-street.—Large office premises are being erected upon the corner of Fenchurch-street and Mincing-lane, E.C. The builders are Messrs. Trollope & Colls, Ltd., 5, Coleman-street, E.C.2. The plans have been prepared by Messrs. Campbell Jones, Son & Smithers, 9, Dowgate-hill, Cannon-street, E.C.4.

Fulham.—A site in Fulham-road, S.W., has been acquired by the Midland Bank, Ltd., for the erection of new premises. The architects are Messrs. Elcock & Sutcliffe, 21, Northumberland-avenue, W.C.2. The builders are Messrs. Mullen & Lumsden, Ltd., 41, Eagle-street, W.

Harrow-road. — ENLARGEMENT. — The Coliseum, Harrow-road, W., is to be enlarged by the erection of an additional circle bringing the seating capacity up to 1,300. The architect is Mr. J. Stanley Beard, F.R.I.B.A., 101, Baker-street, W.1.

Kingsway.—REBUILDING.—The Westminster City Council has approved revised plans submitted by Messrs. Emden, Egan and Co., architects, of 7, Garrick-street, for Messrs. St. Clement's Press, Ltd., for the rebuilding of the St. Clement's Danes Vestry Hall, Portugal-street, Kingsway, W.C.2.

Tufton-street.—PREMISES.—Messrs. Browett, Taylor, Robertson and Morgan, of 3 and 4, Lincoln's Inn Fields, W.C.2, are proposing to erect a building on the site on the western side of Tufton-street, abutting on Marsham-street.

Lewisham.—HOUSES.—Mr. J. G. Stephenson, for the London County Council, has submitted plans for another 100 houses on the Downham Estate for approval of the Lewisham Borough Council.

Leyton.—SCHOOL.—The Essex E.C. have accepted the tender of Mr. F. R. Hipperson, of 6, Broad-street-place, for the erection of the new secondary school for boys. The tender price is £49,479.

Plaistow.—ADDITIONS.—Mr. F. J. Coxhead, of Leytonstone, has secured the contract for the erection of additions to Upton Cross school, Plaistow, for the West Ham Education Committee. Mr. J. H. Jacques, L.R.I.B.A., 61, West Ham-lane, E.15, is the architect.

Poplar.—BUILDING.—The London County Council recommend that, subject to the consent of the Minister of Health, a site in the Birchfield-street area be sold for £300 to Truman, Hanbury, Buxton & Co., Ltd.

Regent's Park.—A large block of residential flats is to be erected upon the Abbey Lodge estate, near Hanover Gate, N.W.1, containing 56 flats in five floors, designed by Messrs. Wills & Kaula, 22, Southampton-street, W.C.1. The builders are The General Building Co., 48, St. Martin's-lane, W.C.

Southwark. — DWELLINGS. — The London County Council are proposing to let a portion of the site on which now stands the Southwark Chapel and burial ground adjoining Hankey-place, Southwark, to the Church Army Housing, Ltd., for the erection of working-class dwellings.

THE LANDLORD AND TENANT (No. 2) BILL

AS AMENDED ON REPORT AND READ A THIRD TIME

We may shortly note the amendments made in the Landlord and Tenant (No. 2) Bill made on Report bringing it up to the date of the third reading. In clause 1 (1) the Bill has been amended, making the time within which a claim has to be made for improvements the same as the time in a claim in respect of goodwill under clause 4 (1), that is to say, "in the case of a tenancy terminated by notice, within one month after the notice was sent or received by the tenant, (the word "sent" does not still appear in clause 4), and in any other case not more than 36 nor less than 12 months before the termination of the tenancy. In clause 2 (1) there is an additional reason inserted which will disentitle a tenant to compensation for improvements, viz., if the improvement is "made in pursuance of a statutory obligation," whilst in subclause (2) the rent to be fixed where an offer of renewal is accepted is to be the rent which in the opinion of the tribunal "a willing lessee other than the tenant would agree to give and a willing lessor would agree to accept," the amendment making the subclause accord with the similar provision as regards goodwill contained in clause 4 (2). The only other substantial amendment in this clause is an addition at the end of subclause (4) giving the tribunal power to suspend the execution of any order as to costs until the expiration of the time fixed by the tribunal for the completion of any improvement.

In clause 4 (1) the time within which a claim for compensation for goodwill has to be made is, with the exception we have stated above, as respects the date the notice is "sent," brought into line with clause 1 (1): The period during which a business has to be carried on at the premises has been reduced from seven years to five, and it has to be proved goodwill has become attached to the premises "by reason whereof the premises could be let at a higher rent than they would have realised had no such goodwill attached thereto." In the proviso (*a*) an addition has been made where a change of user is proved as now not only has it to be different but also more profitable.

We may pass over a minor amendment in paragraph (*b*), but an important addition has been made in paragraph (*d*) as in determining the amount of compensation for goodwill; now it is provided "the tribunal shall disregard any value which is attributable exclusively to the situation of the premises."

The next amendment of importance occurs in clause 5 (3) (*b*). In the grounds a landlord may prove as showing the grant of a new lease not to be reasonable paragraph iv in the Bill is now omitted. That paragraph provided "Where the landlord is a Government department or a local or public authority or a statutory or public utility company that the premises are required for the purposes of the department or authority or of the undertaking of the company." Subclause (7) has been considerably amended and now reads: "The tribunal shall not order the grant of a new lease under this section if the landlord offers as an alternative thereto to sell to the tenant the landlord's interest in the premises *for such consideration as* failing agreement the tribunal may determine, and the duration of the landlord's interest is in the opinion of the tribunal adequate, *and the consideration may as to the whole or any part thereof, if the tribunal so determines be in the form of a terminable rent charge for such amount and of such duration not exceeding the duration of the landlord's interest as the tribunal may fix.*" We italicise the alteration.

Subclause (11) has been redrafted: In the Bill as it left Committee it was provided that where the new lease ordered to be granted would extend beyond the term of the lease held by the immediate landlord that lease so far as it related to the premises in question should be surrendered; but the subclause as now drawn gives the tribunal power to order the grant of such lease and reversionary leases that the combined effect will be the grant of a new lease for the term granted.

The above are the principal changes effected in Part I.

Part II.

In Part II., clause 17, which relates to "Limitation on damages for breach of covenant to repair," a new subclause has been added, numbered (2). It is intended to secure that before a right of re-entry or forfeiture is enforced, the provisions of section 146 of the Law of Property Act, 1925 (better known as section 14 of the Conveyancing Act, 1881), requiring notice of the breach and giving the opportunity of remedy, has reached the lessee affected. Under the Bill the lessor has to prove that the fact that such notice has been served on the lessee was known (*a*) either to the lessee, or (*b*) to an under-lessee holding under an under-lease which reserved a nominal reversion only to the lessee, or (*c*) to the person who last paid the rent due under the lease, either on his own behalf or as agent for the lessee or under-lessee, and that a time reasonably sufficient to enable the repairs to be executed has elapsed since the time when the fact of the service of the notice came to the knowledge of any such person.

Clause 18 has been re-drafted so far as it relates to leases for more than 40 years, and now reads: "And if the lease is for more than 40 years and is made in consideration wholly or partially of the erection or the substantial improvement, addition or alteration of buildings, and the lessor is not one of the bodies mentioned in section 4 (1), paragraph (*f*), to a proviso to the effect that in the case of any assignment, under-letting, charging or parting with the possession (whether by the holders of the lease or any under-tenant, whether immediate or not) effected more than 7 years before the end of the term, no consent or licence shall be required, but notice in writing of the transaction shall be given to the lessor within six months after the transaction is effected." The alteration of the subclause amounts to the exclusion from this provision of any Government department, or a local or public authority, or a charity or a statutory or public utility company, and the inclusion of the provision as to notice of the transaction being given in cases which fall within the provision. "Charities" were added to the above bodies under section 4 (1) (*f*) on the Report stage. This concludes the amendments in Part II.

Part III.

In Part III., clause 20 (1), a new subclause (3) has been added, that in any proceedings before the tribunal not more than one expert witness on either side shall be heard, unless the tribunal otherwise directs.

To clause 22, which relates to services of notices, a new provision has been added, dealing with cases where "the original landlord," that is, the person entitled to receive the rents and profits of the holding, has been changed. Two alterations have been made in the definition clause—24. The expression "tenant" read, as the Bill left Committee, any person entitled in possession to the holding under any contract of tenancy "for a year or for any longer period, . . ." the latter words are now left out, and then the definition continues as before. There is a definition now of "Predecessors in title," as meaning: "Any person through whom the tenant has derived title, whether by assignment, by will, by intestacy, or by operation of law."

These are all the amendments of any importance introduced in the Report stage, and the Bill will go to the House of Lords in the form we have indicated in our articles

---

THE "TRIBUNAL" UNDER THE LANDLORD AND TENANT BILL

THE Landlord and Tenant (No. 2) Bill has passed the Committee stage in the House of Lords, and we shall refer to the amendments introduced in the House when the Bill has passed its third reading. But an important amendment was introduced by the Lord Chancellor, relating to the tribunal, which we will note at once, as this has been one of the contentious points in the Bill.

Instead of the tribunal being the court of first instance, so to speak, with a right in certain cases of removal to the High Court under the Lord Chancellor's amendment cases will be commenced in the county court of the district in which the property is situated, with a power of removal to the High Court in certain cases, no doubt those provided for in the Bill for removal from the tribunal to the High Court, viz., the magnitude of the claim and the questions of law involved. The county courts will not in the first instance adjudicate on the cases, but will refer them to a member of the panel of referees to be selected by the registrar, and if the Justices object, by the judge. The referee will hear the cases and report to the judge of the county court, and at this stage either party can take objection to the report. If no objection is taken the report will be given effect to by an order of the judge, giving it the effect of a judgment. If objections are taken the judge will hear the parties and give his decision, and from that decision, under the existing County Courts Acts, there will be an appeal on questions of law to a Divisional Court, but no further, unless by leave of the Court. The Lord Chancellor promises to consider a further amendment that cases where the amount claimed exceeded £ should commence in the High Court.

We have always objected to the creation of the special tribunal, but the amendment moved by the Lord Chancellor, and accepted by the House, appears to meet all objections as it, in fact, follows the procedure now available in ordinary cases, and in no way ousts the jurisdiction of the Courts.

As regards the further amendment promised consideration as to jurisdiction being given the first instance to the High Court where the amount claimed exceeds £500, one objection occurs to us to which attention may be drawn. The claims involved under the Bill will be extremely difficult to place a money value upon in the first instance, and in such cases it has been found in connection with the limited jurisdiction between the county courts and the High Court imposed by reference to the amount of claim, that difficulties have occurred. If a case is brought in the High Court which should have been brought in the county court, the party bringing it is liable only to recover costs on the county court scale, and litigation has resulted from having to determine whether or not a case was properly instituted in the High Court. In matters where the amount of money involved may be obscure, as is the case under this Bill, it therefore appears to us that the proposal of the Lord Chancellor is better unamended and that all cases should be instituted in the county court, but with a power of removal to the High Court after the reference of the case to the referee.

Oxford Preservation Trust.

The Prince of Wales has written to the Warden of New College, Oxford (Dr. H. A. L. Fisher), expressing his sympathy with the objects of the Oxford Preservation Trust and sending a contribution to its funds.

For rates of wages in the Building Trade in Scotland, see page 960.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, etc., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

BUILDING, PAINTING, ELECTRIC LIGHTING, HEATING ETC.

Dec. 19.—**Alnwick.**—Hot-water System.—Installation into 3 pairs of flats in King-st. G. K. Taylor, Council Offices.

Dec. 19.—**Bury St. Edmund's.**—Houses.—60 houses on Perry's Barn site, for T.C. R. H. Beaumont, B.S. Dep. £2 2s

*Dec. 19.—**Canterbury.**—Practical Instruction Centre for Boys.—Erection of, for T.C. City S.

Dec. 19.—**Derby.**—Shed.—Car shed and bus garage, Osmaston-rd., Derby, for Corporation. A. Clews, B.S. Dep. £1 1s.

Dec. 19.—**Dukinfield.**—Houses.—2, or any multiple of 2, semi-detached houses of four rooms each, on Dewsnap-lane site, for T.C. B.S. Dep. £2 2s.

Dec. 19.—**Eastwood.**—Extensions.—Children's playing ground and extension of existing hall, in Farlane, Rotherham, for Miners' Welfare Committee. Chas. A. Broadhead, architect, Devonshire-house, Moorgate, Rotherham. Dep. 10s. 6d.

Dec. 19.—**Edinburgh.**—Building.—2 residential blocks, A1 and A2, at Gogarburn Institution, for District Board of Control. S. Kaye, A.R.I.B.A., 14, Hill-st.

Dec. 19.—**Hanworth.**—Houses.—Erection of 18 houses for Staines R.D.C. The Surveyor, London-road, Ashford, Middlesex. Dep. £2 2s.

Dec. 19.—**Hull.**—Alterations.—Also additions to offices, etc., at Tram Depot, Cottingham-rd., for Tramways Committee. City Architect. Dep. £2 2s.

Dec. 19.—**Lancaster.**—Alterations.—Also additions to Tymns' Cafe, Church-st., Lancaster. R. W. Jackson, architect and surveyor, 43, Church-st.

Dec. 19.—**Leamington Spa.**—Cottages.—Erection of (a) 50 non-parlour type cottages and (b) 12 parlour type cottages, for the Corporation. Borough Engineer, Town Hall, Leamington Spa. Dep. £2 2s.

Dec. 19.—**London.**—Houses.—102 houses and 112 flats on Lewisham (Grove-park) housing scheme, for Lewisham B.C. W. R. Davidge, F.R.I.B.A., 5, Victoria-st., S.W.1. Dep. £2 2s.

Dec. 19.—**Newquay.**—Houses.—40, for U.D.C. C. W. Walters, deputy-surveyor. Dep £5.

Dec. 19.—**Spenborough.**—Houses.—70 on Gomersal site, for U.D.C. A. Rothera, S.

Dec. 19.—**Wakefield.**—Plasterers' Work.—In connection with alterations to ward 35 at Mental Hospital, for West Riding C.C. W. E. H. Burton, architect and engineer, Wakefield.

Dec. 20.—**Barton.**—Sub-station.—Electricity sub-station at Urmston, for Barton and Urmston Joint Electricity Board. J. A. Robertson, consulting engineer, 20, Brazennose-st., Manchester.

Dec. 20.—**Biggleswade, Beds.**—60 houses.—Erection of 20 houses each in the parishes of (a) Arlesey, (b) Potton, (c) Stotfold, for the R.D.C. The Clerk, 2, London-road, Biggleswade, Beds. Dep. £2 2s.

Dec. 20.—**Bootle.**—Houses.—119, on Monfa-rd., Ainsdale-rd., and Fernhill-rd., for C.B. B.E. and S. Dep. £2 2s.

Dec. 20.—**Bridlington.**—Conversion.—Of shop premises, 27, Hilderthorpe-rd., for J. F. Sellers. J. R. Earnshaw, architect and surveyor, Estate Office, Kingsgate.

Dec. 20.—**Darlington.**—Additions.—Also alterations to Neasham Abbey, Neasham, Darlington, for G. Tristram Edwards. Cayley, Lowry & Co., architects and surveyors, 3, Coniscliffe-rd.

Dec. 20.—**Fareham.**—Alterations.—To Poor Law Institution, for B.G. Master of Institution, Wickham-rd.

Dec. 20.—**Halifax.**—Houses.—8, on Well Green estate, Hove Edge. G. R. Oddy, chartered architect, Ward's End-chambers.

Dec. 20.—**Henley-on-Thames.**—Cottages.—Eight, at Playhatch, Eye and Dunsden, for R.D.C. E. V. Ive, architect, Hillside, Vicarage-rd.

Dec. 20.—**Hertford.**—Additions.—To ladies' lavatory in Castle Grounds, for Corporation. B.S. Dep. £1 1s.

Dec. 20.—**Liverpool.**—Painting.—External, and sundry repairs at:—(1) Kensington-gardens, (2) Kirkdale Recreation ground, for T.C. Land Steward and Surveyor.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

TRADE NEWS

Glazed and Terra-Cotta Fireplaces.

We learn that Messrs. Candy & Co., Ltd., makers of the well-known "Devon Fires," have removed to new premises at Devon House, 60, Berners-street, W.1. Telephone: Museum 1358.

Portable Band Saws.

We have received from Messrs. A. Ransome and Co., Ltd., of Newark-on-Trent, details of their new Type 333 portable bench band saw. This may be run from an electric light circuit and has two speeds for cutting wood and soft metal, while the table may be tilted to an angle of 45 degrees. We understand that a great variety of curved and straight work can be sawn, as it can be run at full speed for woodwork and at half-speed for cutting soft metals and the like. A folder describing and illustrating the machine may be obtained from the makers.

"Fittings of Distinction."

Under this title, Messrs. O'Brien Thomas and Co., 17, Upper Thames-street, E.C.4, have issued an attractive catalogue (No. 51) of fireplaces and sanitary goods, which is illustrated by the photogravure process. Some good fireplaces, baths, etc., are shown in the pages of the catalogue, which will be sent to architects upon application.

Time Sheets.

Readers requiring anything in the way of time-sheets should communicate with Messrs. J. C. King, Ltd., 42-60, Goswell-road, E.C., who make a speciality of these, together with prime cost books and other office stationery, ranging from filing cabinets and loose-leaf ledgers down to simple enclosure slips, etc. Most forms of time-sheets, cost books, etc., are kept in stock, with rulings to suit engineers, contractors, surveyors, auctioneers and others. Messrs. King inform us that they will be pleased to send samples free of charge to anyone interested.

THE SCOTTISH BUILD

THE KELVIN HALL, GLASGOW

A LECTURE on "The Kelvin Hall, Glasgow," was delivered by Mr. Thomas Somers, Master of Works and City Engineer, Glasgow, to the members of the Edinburgh Architectural Association. Mr. F. C. Mears, F.R.I.B.A., occupied the chair, and briefly introduced the lecturer, who, after giving a general description of the site occupied by the original Kelvin Hall, explained that the reason why the Corporation were advised to erect the present type of building was to secure the largest amount of floor space for an exhibition hall with the least possible number of pillars. As a result, in an area totalling 171,000 square feet, there were in the new Kelvin hall only 22 columns. He showed in detail the method of construction adopted for roofing over the main hall and the general provisions which were made throughout the building in order to provide every facility for exhibitors. The curved roof, which was of reinforced concrete, had the largest span of the kind yet attempted in Britain. The lecturer showed the amount of daylight available within the main hall of the building even during the winter months. He also described in detail the artificial lighting provided, also the water supply, heating installation, and drainage arrangements. He said the Kelvin Hall was entirely of fireproof construction, and there was provided an automatic fire alarm installation. Other services for the convenience of exhibitors were the telephone, post office, stores, cloakroom, and lavatory accommodation. The exits were, he pointed out, particularly well adapted for a public hall of the kind.

A description of the hall with illustration was given in our issue for September 23.

Builder's Estate.

The will of the late Mr. John Pain Isbell, retired builder and contractor, of Fowey, Cornwall, has been proved at the gross value of £8,385, with net personalty £8,317.

NEW BUILDINGS SCOTLAND

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXIII. No. 4429

DECEMBER 23, 1927.

THE PILLAR OF SALT

THE recent correspondence in the columns of the daily Press on the suitability of one or other of the historical "styles" to the expression of the skill of the architect in the buildings he plans raises a question which will, doubtless, never be solved by discussion, although it more than probable that, while our masters write, may be others who (obeying the instincts of creative) will unconsciously produce something new, evolved from ly of the fundamental principles of architecture, yet not d in the dead forms ot a revived mediævalism or the typed repetition of some version of the ancient archi- e of Greece or Rome.

hout too great an optimism we think it can fairly be iat, since the war, there has been an increased and growing icy—especially in the architecture of our cities—to ntrate on essentials, to remember that no successful ecture is produced from a muddled or badly proportioned that simplicity is usually more effective than architec- nillinery of whatever style or period, and that a building claims to be architecture should have a character and ality of its own.

s usually supposed by the man in the street that archi- e is some mysterious art which only the cultured few can judge, that it is produced, in some more or less magical y the architect alone, and that none but the initiated n the joy of creation.

re is no legend more harmful to the cause we all have at -the improvement of architecture—than this erroneous sion. In all periods, and in none more than in our own the greatest achievements in architecture—the really sive cathedral, the successful store, bank, insurance or cinema—is the outcome of four factors: the architect, ent, those who translate the plans (evolved after many ions, differences or enthusiasms) into the actual building and, finally, the materials with which the building is to structed.

aspect of architecture is part of its very life: had the ct alone been the unchallenged dictator of all great gs erected, there would, very likely, have been no change "form" of architectural expression since the days of t Greece or Rome. The most probable ot the reasons evolution of the elaborate architectural system of the Ages was the desire for wide interior open spaces, coupled he limitations of the available building materials; a n which could not be solved by looking backwards at ildings of the past.

larly, the Renaissance in architecture was due, not only creative genius of the architects, but to the desire of their s that the buildings they required should express the f the age in the style of the great architectural achieve- of Greece and Rome.

the mainspring ot all this—the essential of essentials— e spirit of enthusiasm: the people were interested in cture and their great princes and nobles were sufficiently ited with the canons and proportions ot the new style t an undoubted influence on the work of the architect. fine architecture grew and flourished; it was a thing paying for and saving for, it was one ot the chief expres- f the culture of the age, enjoyed, criticised and appre- by all. Are we gradually returning to this golden age? there is no clear indication that such is the case, but nd portents are not lacking.

ediately preceding each of the periods of notable ctural achievement there has generally been a period of change in decoration and furniture. Sometimes these have overlapped, as was the case in the early days of the Italian Renaissance, and again, in England, in the remarkable work of the eighteenth century, culminating with the Brothers Adam.

To-day, few would deny that, with all its faults and vulgarities, public taste in decoration has greatly improved from the drab, prim efforts of the later Victorians, and one can only hope that public interest will soon be sufficiently aroused to demand that any person with claims to education shall at least have sufficient knowledge to be able to distinguish between a work of architecture and a building which has "just growed." But the question then arises, are our architects prepared? Have they solved the new problems, more particularly in what may be called the architecture of commerce, whereby modern needs and requirements may be adequately expressed and the possibilities of a great and varied range of building materials and methods be considered in their relation to architectural design? If no decided answer can be given to these pertinent questions (and the recent correspondence would seem to show that there is still room for some doubt in the matter) would it not be better for our modern architects to see that they are prepared before complaining of public indifference to good architecture, remembering that when such interest does come into existence it will certainly demand something more stimulating than a skilful and scholarly combination of either the Gothic or the Renaissance elements in architectural composition.

We do not suggest that we, in this sane, conservative England of ours, should emulate the more startling examples of modern architecture in the United States or on the Continent of Europe; it will probably be agreed that the process of "Americanisation" has already produced some devastating results, especially in our provincial towns. Nor do we suggest that we should emulate the reforming zeal of some of our "modernist" Continental colleagues which have, in at least one case—mentioned at the recent International Congress—resulted in the somewhat unusual situation of a protest from a client being backed up by a refusal of the workmen to construct a building which they considered to be too irreconcilable with their ideas of the beautiful to have anything to do with.

We in England have tradition too deeply implanted in the character of our race to look with favour on any work of art which has not its roots in the past. In each succeeding period of architecture in our land this inclination has, sooner or later, changed the character of all styles which have come to us from other countries, and we have no doubt that any further development will follow the same immutable course of evolution. But architects should not be archæologists and should look forward rather than backward.

In the Biblical narrative of the destruction of the Cities of the Plain it will be remembered that Lot, his wife and his daughters were commanded to flee for their lives, and were warned above all things not to look back on the doomed cities. All escaped unharmed (we are told) except Lot's wife, who hesitated, looked back, and thereupon became changed into a pillar of salt.

May we apply the lesson of this story to modern architecture, and suggest that we should have faith and boldly go forward into the unknown, taking with us the knowledge and experience of the work of our foretathers, but never looking backwards with regret to the cities of the past, lest we too become pillars of salt in a dead land.

NOTES

The Immediate London Problem.

The difficulties of the river bridges problem in London are illustrated afresh by the report of the sub-committee of the Bridge House Estates on Ludgate Bridge. This Committee's report has been adopted by the Bridge House Estates and it will come before the Court of Common Council early in the New Year. The report says that the Ludgate Bridge as recommended by the Royal Commission was hastily conceived, unsuitable in its route, and impossible to carry out at anything like the cost indicated in the Commission's report, and the Court is recommended not to adopt it. These high-level bridges present special disadvantages which can never be altogether overcome. We are inclined to doubt some of the conclusions reached as to the probable traffic results in nearly all the schemes put forward, but we do insist that the first and immediate problem which calls for settlement is as to the future of the railways. Is it conceivable that we are to accept the railway bridge at Blackfriars as a permanent difficulty and eyesore, and the utterly uneconomic arrangements of in and out traffic across the river to Cannon Street and Charing Cross? Surely these are matters which an enlightened and progressive policy for a great city should take into account. We have great respect for the ability shown by the Royal Commission on Bridges, but we cannot help asking why the Commission did not primarily insist on a revision of our antiquated procedure with overhead railways which if once relegated to underground would remove a host of difficulties and add incalculably to the general amenity of London.

The Growth of Oxford.

An exceptional opportunity will be presented in the New Year to the Trustees of the Oxford University Preservation Trust to show the country their practical resolution to help forward the future growth of the city. This month the Ministry of Health has officially sanctioned the Preliminary Statement and Map No. 2 of the local town-planning scheme. This covers not only the city of Oxford, but the whole of the countryside for three miles radius from Carfax, and gives legal authority to the city to control various developments. For example, on the new map the river banks along the Thames and the Cherwell are painted green. This means that instead of being made available at some future time for possible industrial development, as was threatened in the original scheme, they are now preserved for all time as open spaces not to be built on. This is an asset to the beauty of Oxford, and also to the growing population. For Oxford's industrial growth is rapidly extending. Already a new works for pressed steel has settled in Oxford, and works for motor tyres and for accessories are about to established. As the population gre it will become the more imperative retain open spaces as lungs for the to On this matter the Colleges, up to present, have not seen fit, for var reasons, to take the extreme actio agreeing that the sports grounds use the undergraduates should be mar green on the map as private open spa By such agreement they would no any way imperil their ownership, would ensure that these grounds sh never be built on in the future.

Shopping Accommodation in Oxford.

There is also an urg need for some members the Trust to take up serio the question of shopp accommodation in the In certain quarters there is an agita for higher buildings to be allowed the "Corn" and the "High" tha permitted under the existing regulati Several prominent members of the U versity have flirted with the i apparently not appreciating that if h buildings are allowed to be erec there is a danger that both the C Market and the High Street, which admittedly narrow, may become n tunnels which will be reached by the for only short portions of the day. is true that the increased populatio making the shops demand more sp but it is being strongly urged that n branches of the shops should be establis at Headington and elsewhere for convenience of the growing indus population. There are at present 16 people in the outside area, and 55 in the city area. Instead of the subur dwellers having to shop in the c adding to the congestion, it is hc that certain shops will establish branc and will abandon their present camp for permission to be given for the erec of higher buildings on their pre sites. This is a matter that is be brought forcibly to the notice of Oxford Preservation Trust.

Wall Paintings in the House of Commons.

Through the courtesy Mr. Thomas Wilson, Dep Keeper of Westminster P we illustrate in these p two reconstructions by fessor E. W. Tristram of mediæval paintings from the Painted Chamber St. Stephen's Chapel. One illustrates legend of the Beggar and the Ring, a of special interest in that it is one of earliest traditional portraits of Edw the Confessor. This is dated about 1 The other illustration shows an Ang Westminster, and is from the arca St. Stephen's Chapel. The date of is 1350–60, nearly a century later.

History of the Paintings.

The pictures in the Pai Chamber were rediscov in 1800, and in 1819 were uncovered on removal of the tap which had hung on the walls of Chamber. Happily, in the former careful sketches and records were

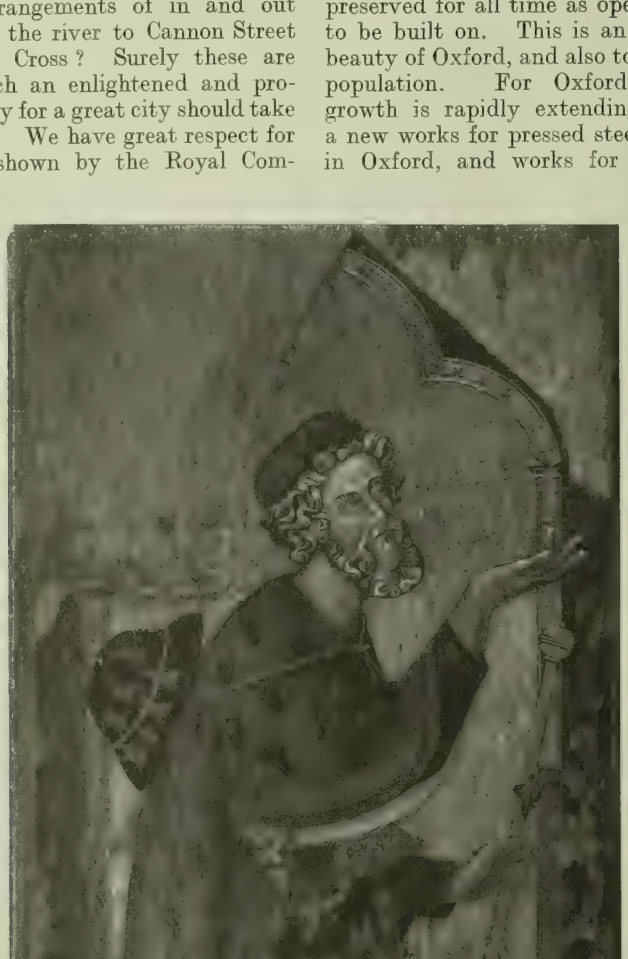

Figure from "The Beggar and the Ring," The Painted Chamber, St. Stephen's Chapel, Westminster. (1270.)

Angel from the Arcade in St. Stephen's Chapel, Westminster. (1350-60.)

the Clerk of Works at the Palace of tminster, and in 1819 Stothard was loyed by the Society of Antiquaries nake sketches of the paintings, which e published in 1842. On the data provided, Professor Tristram has d his reconstruction. Our illustra- of the Angel of Westminster is one vo pictures placed recently at the foot he members' staircase among the re- tructions of the altar paintings from Stephen's Chapel. These also were in the fire of 1834, but very good rds of them had been obtained by rke and Smith owing to a fortunate umstance. When 100 Irish members e added to the House of Commons by Act of Union of 1800, it became ssary to take down the wainscoting l by Wren in order to provide the tional accommodation. The paint- were discovered behind a panelling a glimpse was thus obtained, and erved by the artists, of the wall rations, sculpture, and stained glass ch had made the chapel a shrine of onal art in the fourteenth century. paintings are probably a century r than those of the Painted Chamber show a marked advance. The re- truction of these notable memorials the past has been made possible ugh the gifts of a number of present former members of the House of mons.

n Old nglish Art.

When it is remembered that these wall-paintings have been in existence for upwards of six hundred years, it offers conclusive proof that the ure to last that has been the cause of non-success of many modern efforts reproduce the skill and execution of the old English masters of mural decoration can no longer be attributed to the English climate. Mural decoration is unconnected with any other form of painting: it is a separate and defined art and not a "side-line," and as such requires vigorous and disciplined study and research.

Sir Frank Dicksee's Address.

Though we may well regret some of the more extreme interpretations of art to-day, and also a very foolish tendency to decry the work of deceased artists, like G. F. Watts, by the side of whom their exponents are of very small account, we think no less that a quite exaggerated importance is given by the President of the R.A. to certain modern tendencies in his recent address. Such exaggerated castigation and applied so continually tends to create sympathy for the victims, and a desire to know more of their work. If we had less denunciation and more particular examples of this vicious mentality in art, it would help us a good deal more. Otherwise, such condemnation appears vague and unsatisfactory. For what is this work the President attacks with so much zeal that he is moved to describe it as an "unclean presence needing a leper's bell to protect us from infection"? We would like to reassure the President that present-day art is not all upside down, and that when he talks of the cult of the ugly with such scorn, we have also to remember the cult of the pretty of the late Victorian age. We do not hesitate to give our preference to the former, for the art that does not aim to win us at first sight and is experimental and very earnest, though we may choose to call it ugly, in contrast to its Victorian predecessor, is a really very much better thing. There are new fields being explored to-day—new interpretations—and we should be very careful not to decry these results of conviction and experiment, often on the road to the best things.

Spandril of Truss, the Great Hall, Hampton Court Palace.

(*See page* 971.)

GENERAL NEWS

Professional Announcements.

Mr. Horace W. Langdon, chartered quantity surveyor, has removed from 57/8, Chancery-lane, W.C. 2, to 292, High Holborn, W.C.1.

We learn that after Christmas Day Mr. P. J. Westwood's, F.R.I.B.A., address will be 14, Buckingham-street, Adelphi, W.C.2; Gerrard 4823-4.

Mr. W. H. Ansell, F.R.I.B.A., has changed his office address to No. 59, Doughty-street, W.C.1.

"Old English Drinking Glasses."

A sessional evening meeting of the members of the Auctioneers' and Estate Agents' Institute of the United Kingdom will be held at 29, Lincoln's Inn-fields, W.C.2, on January 5, 1928, at 7.30 p.m., when Mr. Grant R. Francis, F.S.A., will deliver a paper entitled "Old English Drinking Glasses."

Fate of Cheyne-row Trees.

Chelsea Council on December 14 decided to cut down two of the nine trees opposite Carlyle's house in Cheyne-row, Chelsea, on the ground that they are a danger, and exclude light and air from historic houses opposite. The original scheme, which caused much opposition, was to cut down all nine trees. The Council decided to save seven for a year, and then to consider their fate again.

R.I.B.A. Lectures on Architecture for Children.

On Friday, December 30, Mr. C. H. B. Quennell, F.R.I.B.A., and Mrs. Quennell will give a lantern show on architecture for children at 9, Conduit-street, W.1. This, the first of a series of three lectures to be delivered during the Christmas holidays, will deal with "Everyday Things in Roman Britain." Admission is free, on tickets to be obtained from members of the R.I.B.A.

Rural Housing.

Mr. Neville Chamberlain, Minister of Health, has received a deputation organised by the Council for the Preservation of Rural England, which was introduced by Mr. Percy Hurd, M.P., and included Mr. Guy Dawber and Professor Adshead, of the Royal Institute of British Architects; Professor Abercrombie, of the Town Planning Institute; Mr. E. J. Brown, of the Institute of Builders; and Mr. H. G. Griffin. Mr. Guy Dawber and Professor Abercrombie, speaking on behalf of the deputation, said the Council had prepared a scheme for the establishment of voluntary advisory panels, composed of professional men with a lay element, to advise local authorities and owners on the best manner of providing a modern standard of housing accommodation without destroying the unique architectural beauties of British villages. Mr. Chamberlain cordially welcomed the proposals put before him, which seemed to him to meet the case very fully and admirably. The voluntary character of the scheme was an essential feature. He would do his best to persuade local authorities to accept the help offered to them. While he could not give them a direction, he would express to them his personal approval of the scheme, and his hope that full advantage would be taken of it.

A Girls' School at Dulwich.

A scheme to found a girls' school on the lines of Dulwich College has been authorised by the Board of Education, states the Press Association. The Board has sanctioned changes in the allocation of the revenue of Alleyn's College of God's Gift (Educational) —the foundation of the existing Dulwich College, Alleyn's School, and James Allen's school for girls—by which at least £5,000 a year will be set aside for the purposes of the proposed college for girls, as from last April. No site has been selected, but the new college will probably be in Dulwich.

EFFECT OF FROST ON BUILDING

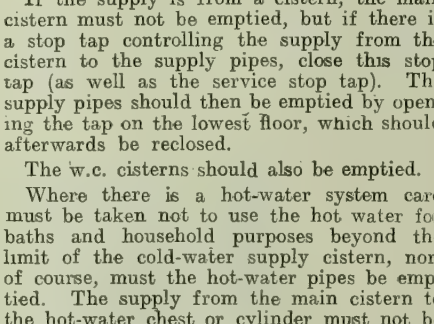
THE recent frosty weather has had a serious effect upon building operations, with the exception of various internal processes. In a statement, Mr. George Hicks, the General Secretary of the Amalgamated Union of Building Trade Workers, has said that 35 per cent. of the members of the union were prevented from working. Coming just before Christmas, he said, the suspension of work was particularly distressing. Mr. Hicks added that the building workers were always at the mercy of the vagaries of the English climate, but the position this week was so bad that the union had decided to circularise their members and advise those who were definitely suspended to register at the employment exchanges and on qualifying to claim insurance benefit. They would then be entitled to a weekly grant of 5s. from the union. The Metropolitan Water Board has circulated the following statement of precautions to prevent frozen and burst pipes :

During periods of severe frost, the water supply from the main should be shut off at night by closing the stop tap. This should be done regularly during severe weather, and the stop tap only opened during the daytime. If the stop tap is closed it will prevent water from entering the service pipes and cisterns.

Some water services are direct from the water main and some are supplied from cisterns.

The stop tap being closed, the following directions should be observed :—

In the cases of supplies direct from the main, open the cold water tap on the lowest floor, run the water out of the pipes and close the tap.



If the supply is from a cistern, the main cistern must not be emptied, but if there is a stop tap controlling the supply from the cistern to the supply pipes, close this stop tap (as well as the service stop tap). The supply pipes should then be emptied by opening the tap on the lowest floor, which should afterwards be reclosed.

The w.c. cisterns should also be emptied.

Where there is a hot-water system care must be taken not to use the hot water for baths and household purposes beyond the limit of the cold-water supply cistern, nor, of course, must the hot-water pipes be emptied. The supply from the main cistern to the hot-water chest or cylinder must not be shut off while hot water is being drawn.

It will be found that the greatest amount of inconvenience generally arises by freezing of the ball-tap at the inlet t storage cistern and to the w.c. flushin terns. Freezing at these points will generally speaking, take place if the supply is cut off by closing the stop ta

If a pipe or tap becomes frozen it s be thawed at the earliest possible mo which may be done by the application water. Dribbling ball valves are gen the first to be frozen up.

Corbel in the Great Hall, Hampton Court Palace. (*See page* 971.)

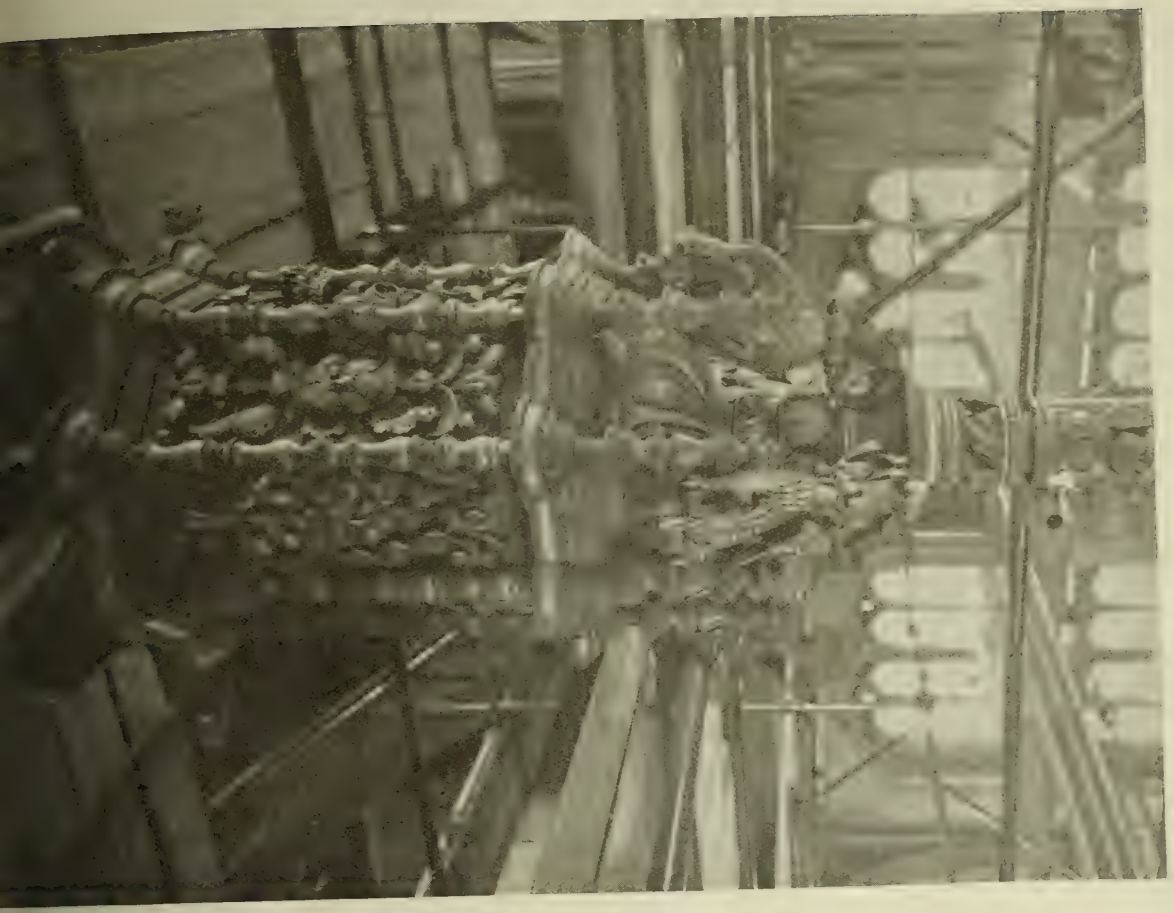
COMPETITION NE

Royal Masonic Girls' School, Rickmansv

The General Committee of the Masonic Institution for Girls invite arc of British nationality to submit comp designs for the school buildings and houses for 400 senior girls, proposed built in a park of 200 acres at Rickmansv Herts. Mr. H. V. Ashley, F.R.I.B. the assessor. Premiums of £750, £500, £300 and £200 are offered. Applicatio conditions and site plans, accompanied deposit of £2 2s., should be made on or Saturday, January 21, 1928, to Mr. M Beachcroft, Secretary, 31, Great Queen-s W.C.2. The latest date for sending signs is Wednesday, September 5, 1928

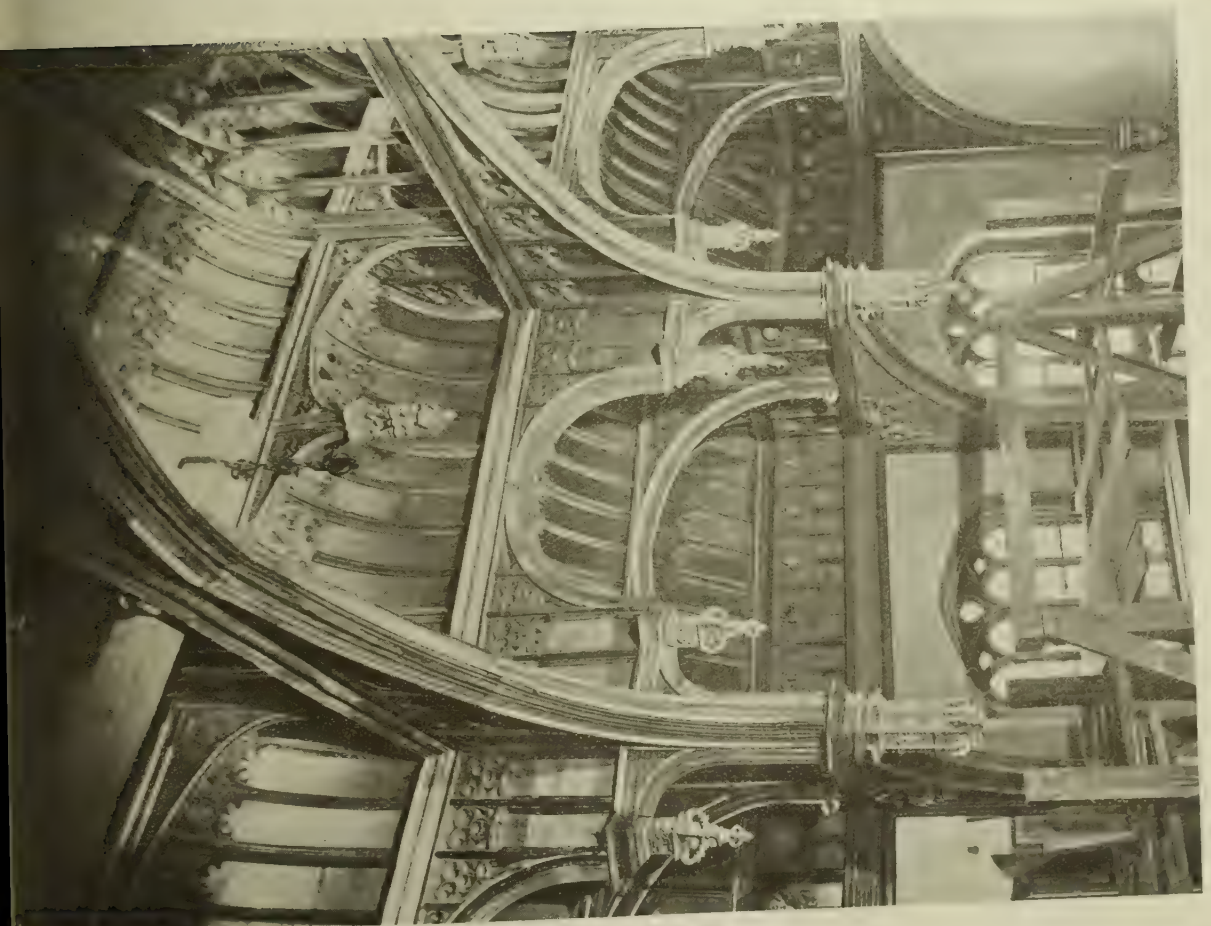
Northumberland Division War Memo

Architects who served overseas in an of the 50th (Northumberland) Division the war are invited to submit designs in petition for a war memorial, to be erect Wieltje, Belgium. Premiums : £50, £15, Assessor : Colonel A. Easton, F.R.I. Hull. Last day for sending in de January 31, 1928. Conditions of the co tion may be obtained from the Honorary tary, Lieut.-Colonel Wm. Anderson, D. M.C., New Market street, Newcastle-Tyne, on deposit of 10s. 6d.



OBITUARY

Mr. E. J. Turnbull.



We regret to record the death of Mr. Turnbull, J.P. for the County of Surrey senior partner in the firm of Messrs. Tur & Son, of Northumberland-alley, Fench street, E.C. The business will be carri by the surviving partners, Messrs. A. Turnbull and W. R. Andrews.

Mr. H. J. Birnstingl, A.R.I.B.A.

We regret to record the death of Mr. Birnstingl, A.R.I.B.A., on December 1 West Wycombe, Bucks, after a sudde tensification of an illness from which he been suffering for some six or seven past. Mr. Birnstingl, who was born in received his architectural education at A.A. School and was articled to Mr. Ch Barry. After the war, following some t months' experience of editorial work i office of an architectural contemporary took up an appointment as an assistant a tect to the Ministry of Health, from w he resigned when, some two years later Government began to restrict its ho activities. After this Mr. Birnstingl s in private practice and carried out som teresting work, including houses at Ang ing, Bognor and Radlett, and a shop fro Church-street, Kensington. He also de a good deal of time to architectural nalism, contributing frequently to columns of *The Builder* and to many architectural publications, British foreign. He had a thorough grasp of his ject and expressed himself vigorously directly. He was a most likeable man. his death at the early age of thirty-five real loss to architectural journalism. funeral took place on Wednesday last a Jewish Cemetery, Willesden-green.

DAMPNESS IN HOUSES.

AT last Monday evening's meeting of the R.I.B.A. (Mr. Walter Tapper, A.R.A., President, in the chair), Dr. Reginald Miller, M.D., F.R.C.P., read a paper on "Some Medical Aspects of Damp in Dwellings," Mr. J. Ernest Franck, F.R.I.B.A., following with a paper on "Dampness in Houses." In the course of his address, Dr. Miller said there were many matters which were of common interest to both the architectural and medical professions. Of these the question of damp in dwelling-houses afforded perhaps the most important outstanding problem. He knew of no definition of damp which was simple and practical enough for ordinary use. In the investigations which he had been directing for the last three years from the Paddington Green Children's Hospital, they had taken as their standard what appeared as damp to an ordinary educated person not specially trained in sanitation. Thus they had judged chiefly by visible signs of damp on walls and ceilings, but also by rotting oilcloth, mildew on unused articles, and damp in clothes in cupboards. They had done their best to distinguish temporary damp from persistent damp, but it must be remembered that damp which was temporary in a rich man's house was usually persistent in the case of the poor.

Passing to the consideration of some of the diseases, or groups of diseases, in whose production they thought that damp rooms played a part, the speaker laid emphasis on the fact that they regarded damp as only one factor in the production of those maladies. They did not for a moment think that if there were no damp houses these diseases would simply disappear; but they did think that damp played its part in their production, and in a varying proportion of cases it played an important part. Further, and sometimes still more clearly, damp might have a notably bad effect on some of those diseases when they had developed, making them more severe, more liable to recur, more difficult to control and to cure.

The speaker then considered in detail three groups of diseases: (1) Catarrhal diseases of children and young subjects; (2) Chronic rheumatic diseases; and (3) Acute rheumatism of children and young subjects.

In his concluding remarks the speaker asked—was it the dampness of the site or of the house that mattered? Of course the two must tend to go together, but he thought the condition of the house itself was the more important. Several facts suggested this. It was, for instance, easy to find rheumatic and non-rheumatic areas very closely adjacent to each other. In Eton town he was told there was plenty of juvenile rheumatism; in Eton College and the two other big schools in the neighbourhood there was virtually none. The sites were not dissimilar; the characters of the buildings were very much so. In Paddington they found that the middle floors of the houses were less damp than the others, and that they provided the fewest cases of rheumatism. This seemed to show that the site itself was not all-important, and also suggested that the chief causes of damp were to be found in faulty construction and dilapidation rather than merely lack of ventilation for, domestic damp of cooking and laundry. Again, Dr. V. Coates, of Bath, told him that in Holland, where damp sites must abound, there was comparatively little juvenile rheumatism. The houses there were kept well heated and therefore dry.

It could not be doubted that, were there fewer damp houses, much and serious illness would be prevented. The present state of affairs was certainly unsatisfactory, and could they feel any sort of assurance as to the future? They were told that the building of residential houses was very largely out of the hands of trained architects, and this hardly reassured them. Then as to the by-laws and regulations of the Ministry of Health and local authorities, did they give us adequate protection, or were we living in a fool's paradise? If they were as valueless as investigations suggested, should they be made more stringent, or would it be better to get rid of them and rest on the law of the land, which still ran, he was told, surprising as it might seem, that a house must not be damp?

Mr. J. Ernest Franck, opening his paper, thanked the medical profession for bringing the subject of dampness in dwellings to the notice of the Institute, and more particularly Dr. Reginald Miller for his paper. The subject, the speaker continued, had been before their Council, who had not only passed a resolution approving of a sub-committee investigating and reporting thereon, but desired to show their interest in the question of damp in houses and their wish to co-operate with the medical profession with a view to obtaining better conditions in existing and future human habitations. There were many factors which determined the general health of a community, but if we took four principal ones, namely, locality or environment, proper feeding, occupation under healthy conditions, and housing, it would appear that environment was a predisposing condition. It might be assumed from evidence that dwellers in rural areas enjoyed better health than the town dweller, even though they might live in more insanitary dwellings and on cheaper food. The determining factor was the open-air exposure, muscular exercise and adequate rest. The rural worker enjoyed the stimulus of the sun and cool, moving air. The two great factors to health were sunshine and cool, moving air. This meant that the condition of living in a close, confined atmosphere was detrimental to health.

As to the conditions under which occupation was carried on, it was clearly shown that in well-ventilated, dry workshops the average mortality was lower than in humid and badly-ventilated buildings. He did not propose to discuss specific instances of damp or details of construction, but to enumerate the principles which should be studied so as to ensure that the community were housed in dry dwellings. Dr. Reginald Miller had very wisely given no definition of damp: that must vary, because the comparative humidity of the atmosphere depended on the temperature. He had, however, said that he had in mind cold damp.

There was no doubt a soil which naturally drained the surface water was a more suitable site for building than one which would retain the water or retard its percolation. The question of soil and its natural drainage had not received consideration in the development of many cities, or parts of cities. It could be shown that where the surface water was not easily drained away from a clay soil there was a greater condensation of moisture, not only in the air but on the walls of buildings—hence a cooler atmosphere, colder buildings, and, further, a less pure air. In building houses on such sites special precautions sh taken to avoid the damp ground a trating the ground floor, and the colou external facing material should be considered.

If we considered this question of co in relation to the containing surfac room, it could be ascertained that which was damp had a much greater conductivity than a dry wall, hence th for speaking of a cold damp. Again wall absorbed and gave off radiant he than a damp wall. In order, there keep the same temperature in a dam as in a dry room, there must be a consumption of fuel. When the am fuel available for consumption was re the natural inclination was to close up apertures as possible and stop the cir of air. Now the first essential in livi or workshop was a free circulation which in a humid climate such as ours to remove excess of moisture and t allowed a more even cooling of the b easier respiration.

Damp, whether temporary or perma a building might result from one defects or a combination of two o defects which alone might not cause such a degree as to be noticeable. might be badly chosen with respect to drainage, or where there was no alt but to build in a damp situation no precautions might be taken either t the site or to introduce a non-conducti between soil and ground floor. Or, a effective method might be adopted of re as far as possible from the foundati rain-water which fell on the structure.

The building should have an effectiv course in the walls and an effective resisting covering under the building walls and roof of the structure mus the weather and be designed to withst most intensive or penetrating rain locality in which the building was si this meant that whilst dryness of b should be uniform, the intensiveness measures to effect that result would various localities.

The speaker then drew attention to portance of each dwelling receiving a sunlight as possible, and the insistence currents of air, both in and arou building. Light was the most univer potent natural germicide and purifie drying and cooling effect of wind w mous, and the air was practically ne out of doors in the open country. T quisites were not only met by restrict number of houses per acre but a proper distribution of the houses s ensure that no pockets of still air w tained about the dwellings. Hence th sity for town planning and a proper tion of the buildings. It likewise that the house or building should be internally to effect a similar purpose, with a structure adequate to resist da disposition of its parts might not gi tive ventilation.

The house should be built and fin that whilst resisting the weather it the requisite degree of warmth. This a selection of material, and as brick lower conductivity than any concret particularly those made with ballast stone aggregate, there was no doubt traditional methods of building had, present, proved superior to all alt methods of construction. It also me the material selected should have, with strength, a relative high porosit allowed a deeper penetration of air that was, a quicker drying structure

By applying the principles previous ciated it followed that thatching or roofs was preferable to slating, and t tively porous lime plasters were su hard and close texture wall covering cautions must be taken to prev penetration of the weather throug

plification of the roof plan was the first ideration, as many meretricious features detracted from the weather-resisting ities of a roof.

r. H. D. Searles-Wood, F.R.I.B.A., in osing a vote of thanks to the speakers, that speaking as Chairman of the nce Committee he could assure them the question of dampness in houses been taken well in hand.

r. Alan E. Munby seconded, and the was carried with acclamation.

the discussion which followed, Sir nphry Rolleston, Bart., K.C.B., said the two papers read had covered the architectural and medical as- s of the case. He would like to re- Mr. Miller's appreciation of, and grati- to, the R.I.B.A. in allowing them to e there that night and discuss a matter uch vital importance to the health and equent prosperity of the nation. Whether R.I.B.A. would benefit he could not say, it was certain that the health of the on would. It required little imagi- on to see that good light—a great enemy disease—thorough ventilation, and com- e dryness were essential to every house.

r. F. J. Poynton, F.R.C.P., said that it a great thing that representatives of two great professions should meet together ehalf of the children. Anything that d be done to prevent rheumatic diseases ld benefit not only our nation but the re world. The question was : How were diseases to be prevented? On the archi- ural side it was most difficult, in view he fact that a great number of houses not erected under the guidance of an itect. He hoped architects would perse- and get their rights and so help to bat this dampness.

r. H. D. Searles-Wood said that the B.A. Science Committee expected some t results from their questionnaires. An ority that could help was the L.C.C., in their London Building Acts dealt the question of damp from a structural t of view rather than health. The stunt ding which had sprung up since the war leading to a serious state of affairs. roofs, he thought, were entirely unsuit- in protecting against damp, as were ment windows, which made it very diffi- to ventilate a room adequately without pness.

r. C. O. Hawthorne said that a great culty was the fact that in the public d widely there existed a notion that pre- ion of disease was a duty of the medical ession. When the question was exam- , however, it became increasingly con- uous that prevention of disease could not ensured only by the medical profession. no citizen could absolutely free himself n blame if any defection of the scheme place. In the end we came down to power of public opinion. The greatest best method of preventing rheumatic ases was to provide healthy environment, there the R.I.B.A. could help.

r. A. P. Thomson, speaking of the pre- live work being carried out in Birming- , said that there they had come to the clusion that a dry site was more impor- than the house as regarded the avoid- e of rheumatism. In future, it ought to possible to ensure that a responsible hority, such as the Ministry of Health, ervised the lay-out and sites of large lding schemes. What was wanted, also, a definition of "dampness" for the pose of action by public authorities.

Ir. Alan E. Munby said that the first ng they had to do was to repeal the Rent trictions Act. He had also noticed that ldings erected some years ago—and especi- those in brick — did not withstand the mpness as well as they had 15 years ago.

fter further discussion Dr. Miller and . Franck replied briefly to points raised, the proceedings closed.

THE LONDON SOCIETY

KING HENRY VIII.'s HALL, HAMPTON COURT PALACE.

On Friday, Sir Frank Baines, C.V.O., C.B.E., F.R.I.B.A., read a paper on this subject to the London Society at the premises of the Royal Society of Arts, Adelphi, W.C.2. Sir Andrew T. Taylor, F.S.A., was in the chair. The lecturer said that King Henry VIII.'s Hall was architecturally and historically a very important and vital portion of the sixteenth-century Tudor Palace originally projected by Cardinal Wolsey. To bring out clearly its immense significance, a word of brief description of the Tudor Palace and its plan would assist in an understanding of its history and the important position which the Hall took in the present-day Tudor remains of the old Royal Palace and House of the great Cardinal. The Tudor Palace at Hampton Court was commenced by Cardinal Wolsey in 1514. In that year he obtained a 99 years' lease of the land, after combining all the available property in the immediate area, to form a great demesne. He continued the work of building, at his own direction and cost, till 1529, although in the year 1525 he made over the Palace to King Henry VIII. under peculiar circumstances arising from his dependence upon the King and as a result of that monarch inquiring closely and critically into the character of his Cardinal's grandiose scheme of house building. Upon Cardinal Wolsey's banishment to Esher in 1529, the King took possession and converted the lease into a freehold; and shortly after, commenced extending, and in part rebuilding the Cardinal's Palace. One of the most important sections of the work undertaken by King Henry VIII. was the Great Hall. The Cardinal had constructed a great wall about the Palace enclosing its precincts, and had instituted a special supply of pure spring water by bringing it a distance of four miles from springs at Coombe Hill—great lengths of the old lead conduits still remained underground. He also instituted a system of great brick sewers for drainage into the Thames—much of which remained to this day. Evidence was not quite clear as to the exact delineation between Cardinal Wolsey's work and the work of King Henry VIII. Certainly the great gate-house at the west front (before the lamentable restoration of 1773) was Wolsey's, together with the great base court, the old kitchens, the shell of the Chapel, the Hall on the site of the present Hall, and the Clock Court on its east and south sides. Taken together, Wolsey's and Henry VIII.'s work constituted the last great piece of traditional mediæval building in the native English style executed by English craftsmen of sixteenth-century England, uninfluenced and unimpeded by foreign standards. The only record of foreign workmanship in the Tudor Palace was the work of Giovanni di Majano, an Italian, who carried out the splendid ceramic roundels, of Roman Emperors, inserted in the turret towers of the gateways.

We knew definitely that the Great Hall was Henry VIII.'s work; also the great Watching Chamber, adjacent to the Hall. The decoration within the Chapel structure (erected by the Cardinal), the Chapel Cloister, the buildings north of the North Cloister and east of the old kitchens, and the State Apartments round the old cloister-green court, were all the work of the King. These Tudor State

The Great Hall, Hampton Court Palace: View of Roof, looking up.

Apartments, probably the only buildings of their kind in the world (on the site of the present buildings which surround the Fountain Court), were irretrievably lost to us as a result of the work of Sir Christopher Wren when he undertook the rebuilding of Hampton Court Palace for King William and Queen Mary between 1689 and 1723. These Hollanders had no sympathy with our native British architecture; a Tudor Palace was apparently no residence for a Dutchman! King Henry VIII.'s work dated from about 1529 to 1536, and again we found the names of the craftsmen engaged upon the work, universally English. He did not propose, said the lecturer, to enumerate the various alterations of Wren's day and subsequent dates, but he would describe the development of the Palace plan and Wren's projected lay-out for the north-east front facing Bushey Park. This plan happily failed in execution, much to the gain of the Tudor Palace. The whole of the work of the Tudor Palace was executed under the still prevailing but fast perishing mediæval guild system, whereby the Cardinal and the King, in each case, supplied the materials by direct purchase for the use of the craftsmen, who contracted for the execution of the work. This execution covered a very complete building and decorative technique, unsurpassed in England since that period. Luckily the work could be followed very closely and accurately, particularly as regards the Great Hall, for the original building accounts of the Palace were preserved, as records of expenditure of the Crown in 13 folio volumes, in the Public Record Office. So paramount was the power of the Cardinal, that included among these records were certain items of Wolsey's expenditure at Hampton Court as though they were part of the records of the King. The accounts revealed that the men were paid by the day, and in King Henry VIII.'s time they were paid at overtime rates for special increased working hours; for there was record that they were paid for working extra "in their own times, and in their drinking times, to hasten the completion of the work to the King's Hall."

In dwelling upon this Great Hall and its amazingly perfect craftsmanship, we had this mournful consideration to bear carefully in mind—that this was one of the last great works of architecture of the traditional English style executed for the King under the old guild system of free craftsmanship. From then onwards the architectural styles developed away from native standards and were based upon the Italian and French Renaissance, unknown to the home-keeping British craftsman; thus the doom of the free English craftsman was sealed and the way cleared for that quite modern creature—the architect.

He did not propose to attempt a comparison between the English traditional Tudor style and the later work of the Renaissance in England; but it was comparatively easy to see the great difference in spirit of the Tudor work at Hampton Court and the more modern buildings of Sir Christopher Wren, based as it is upon the Renaissance tradition, named by a bitter opponent "the resuscitation of a corpse." He would just show, however, how much we had gained by the fact that Wren's great scheme for the lay-out of the north-east front failed to mature; it would have involved the destruction of the original Tudor south and east fronts, the demolition of the incomparable Base Court, and the destruction of Tennis Court-lane. Great architect as Wren was, the lecturer thought that few would venture to suggest that we were other than pleased at the fact of the failure of this complete scheme of rebuilding at Hampton Court.

Wren always meant to preserve the Great Hall of King Henry VIII., even though he had such scant respect for the Tudor work which survived to his day. To him, Tudor architecture was an anachronism; he had no respect for the native British tradition which it represented, and which had been killed by neglect long before his day; but we, with our longer and perhaps more historical review, were able to see what a loss we should have sustained had Wren's original scheme been brought to fruition. Wren was a very great architect, one of the greatest of his day of all time. Let us leave his spirit at p without one word of criticism on our p particularly bearing in mind his last wo when he said: "If I glory, it is in singular mercy of God, Who enabled m begin and to finish my great work, so formable to the ancient and true mod From this it could be seen that Wren's s had returned to, and rested upon, the clas tradition. His great work would stand all time, with the one carping regret on part that he did not leave to us, and a us to delight in, the Great Hall of H Henry VIII., flanked and completed by w must have been an incomparable rang Tudor State apartments round the anc Green Cloister Court, decorated with Kings and Queens of England, and which in all probability the finest work of T architecture England and the world had seen.

Before the Hall of Henry VIII., there of course, the old Hall which preceded built by Cardinal Wolsey. Although we no authentic particulars of this, it was cle not so magnificent or so large a structur the present Hall; for one of the first w of King Henry VIII. was to order the den tion of the old Cardinal's hall, in Febru 1532. This work was pressed forward such expedition that a month later b layers were busy upon the foundations of present Hall. By November of the same the walls were so far advanced that the s corbels to carry the roof principals were b fixed in position, and at this time Ma William Clement, master craftsman King's craftsman, was appointed master penter in complete charge of the work of building of the great timber roof. In 1533, carpenters were working late upon roof, and in July of the same year the for the roof covering was purchased. Ce boards for the upper roof and for the tir vault were paid for in the autumn of year. From October to December, carper were again working overtime, as we records in the accounts of the purchas

The Great Hall, Hampton Court Palace: View of Temporary Roof during construction.

v candles for the men working in their mes and in their drinking times upon eat Hall against the King's coming." uary, 1554, work was recorded as pro- upon the louvre, which formerly ver the Hall in the third bay from the d this was finished during the summer , so that the structural work of the cluding the louvre, occupied roughly ths to complete—a quite remarkable f rapid building for the time. The as, said the lecturer, 106 ft. long and wide, divided into seven bays by six als, with two additional principals the end walls, making eight in all. oof was of a very uncommon if not type, and, unlike most of the roofs period, the pitch is steep, but the part was truncated in the manner of sard or curb roof.

eat deal—in fact, almost the whole—of uctural timbers, beautiful in themselves form and structure, were hidden by tive coved boarding and tracery, which e means by which the Hall was ceiled. rincipals of the roof were of the hammer- type, namely, with no cross-tie below llar beam; this type arose out of the beam type and as a result of the original ion of thick Norman walls for buildings, walls were fully capable of supporting from untied roof principals, the thrust ally being uniformly deposited at short als where each pair of rafters bore its hare of the weight. However, in later when the Gothic and Tudor builders much more lightly but more compactly the Normans, the system of attempting ncentrate the roof pressure by purlins rincipals was followed. This involved expedient for increasing the security, he hammer-beam roof was evolved, with ea of balancing the truss or principal ut putting too great a stress upon the A weak point in the ordinary hammer- truss, where failure usually manifests was at the junction of the queen post, llar, the principal rafter, and the main d purlin. This was generally due, in cases, to the fact that the composite weakened the timbers and that the -watch beetle found points of entry at joints, when by its depredations it tely weakened the timbers at the most rous and heavily stressed points of sup- When this occurred, the principal s bend under the weight of the roof the collar, and their feet either slid on wall top or pushed the wall-head over, e detriment of the stability of the struc- as a whole. The statical analysis of ner-beam roofs of various types, added ecturer, was too complicated and involved ject to enter upon there and then.

e Great Hall roof at Hampton Court, mediate in span between Westminster ol, which was 34 ft. 6 in., and West- ter Hall, which was 69 ft., was also inter- ate in its method of construction, for it a variation or partial use of the great d rib or brace, which formed the most active feature of Westminster Hall roof, to which that roof, in fact, owed its tion. At Westminster Hall the main d rib, arch or brace was built up of members, the two outer continuous and middle one discontinuous. At Hampton t this embryo member consisted of one er only, made up of curved pieces ated from one another by both hammer- s and queen-posts. At Westminster Hall great curved brace or arch was the most icuous feature in *any* view of the roof; at Hampton Court the discontinuous e or arch was invisible, and its only prac- advantage was that, when sound, it ed the lateral thrust transmitted to the from the upper portion of the roof. roof was of quite complicated construc-

e accounts told us that the timber used e roof was bought from Dorking, Holm- l, Leatherhead, Banstead, Berewood, and St. John's Wood. Originally the coved ceiling boards and the filling of the tracery were painted a bright azure blue, which must have had a most striking effect from below. All the elaborate and most wonderful carving was the work of English craftsmen throughout.

The lecturer said that when in 1922 he made an extensive examination of the roof he found it to be in a most precarious condition. It was, in fact, on the very point of collapse. Its condition was partly due to the method of construction adopted by the master carpenter, partly due to the attack of *Xestobium tesselatum*, and partly due to a very virulent attack of dry rot of the *Merulius lacrymans* type. The dry rot attack was particularly noticeable in timbers laid on to, built in, or adjoining walls. For instance, the principal wall plate, which was a massive timber 1 ft. 9 in. by 9 in., of considerable length, was found to be merely a hollow shell and could be crushed with the hand. It was quite incapable of transmitting the weight to the wall end of the hammer beam, or to prevent this sagging and letting down the members it was designed to support. The attack of the death-watch beetle was particularly severe, and was fully active at the junctions of timbers near the outer air, as, for example, the junction of the collar with the queen post and the principal rafter. Again, extensive attack was found at the springing of the principals off the stone corbels; while the wall posts in nearly every instance were very severely attacked. Generally, the defects caused a decided drop of the hammer beams, and an inward leaning of the hammer posts; the truss thrusting out the walls and buttresses, as a result of unsustained lateral pressure, to a varying extent, causing definite failure and fracture of the buttresses. In order to overcome these fundamental defects the trusses had to be stripped, exposed, and strengthened, each truss being fitted with a reinforcement of steel of a girder type, which, while relieving the load of the roof, was designed so as not to bring any appreciable outward pressure on to the walls and buttresses.

Many alternatives to the steel relieving truss design were considered, but no piecing up with oak, no scarfing or jointing to the oak or plating with steel would have met the problem, particularly in instances where resistance to tension was required.

Coming to Eltham Palace Great Hall roof, the date of which was about 1480, we got a very interesting parallel of timber construction. The hall was under the charge of the Commissioners of Woods and Forests, and in 1911 the lecturer made a careful and detailed examination of the condition of the roof, which showed that the roof was in imminent danger of collapse. The walls were leaning outwards, the trusses had heavily sagged, the principal rafters had sprung 8 in. out of truth, and most of the jointings of the timbers, although temporarily secured with straps, was definitely failing, as would be readily realised, owing to the spreading of the principal rafters, which caused certain of the outer walls to overhang as much as 2 ft. 6 in. in a height of 10 ft. The lecturer then spoke, in conclusion, of Middle Temple Hall roof, which was erected during the first half of Queen Elizabeth's reign. This hall, remarkable for its beauty and design, was chosen from many others as the model for the Great Hall of Trinity College, Cambridge, which was completed in 1605.

Sir Andrew Taylor, F.S.A., in proposing a vote of thanks to Sir Frank Baines, said that the lecture had been one of the most amusing and instructive the Society had been privileged to hear. He agreed with Sir Frank that a Tudor style throughout Hampton Court Palace would have been preferable to coming across pieces of architecture in other styles—even Wren's. In conclusion, he thought they had received a complete education in the construction of timber roofs.

CORRESPONDENCE

The Preservation of St. Paul's Cathedral.

Owing to the Christmas Holiday, "Inquisitive's" reply to Mr. William Harvey's letter on this subject, published last week, is held over.

Christ Church Cathedral B.C.

SIR,—My attention has been drawn to a question raised by a correspondent with reference to the main piers of this cathedral. These are being built of synthetic stone, made by the Cosmos Stone Co., of Victoria, B.C., with a core of reinforced concrete. The same principle of construction will be applied to the main piers carrying the central tower, and it may be of interest to state that the stresses and strains have all been very carefully worked out so as to allow an ample margin for safety. All the synthetic stone is, from time to time, being tested as to its strength. The present contract is for the nave only, with the possibility (if funds permit) of building the north-west tower. A temporary east wall will be placed just beyond the first piers of the central tower.

EDWARD P. LAYCOCK,
Archdeacon of Columbia.

A Defence of Quantity Surveyors.

SIR,—In my first letter on this subject I endeavoured to indicate clearly why an architect was in a more "assailable position" than a quantity surveyor when he prepared his own bills of quantities under modern conditions. I cannot think that "Northern Fellow" fails to see this point of view, which is very generally held where industrial development is greatest. I feel, rather, that he is loth to accept or does not fully appreciate the inevitable conditions which are resulting from specialisation and which, whilst demanding a broader knowledge within the particular sphere of work of the individual, limits the specialist capacities in which he can act efficiently towards a client, whether in profession or business.

In relation to the second paragraph of his last letter he has shifted his ground. In his first communication he recognised "qualification" as essential. A man is either qualified or he is not. It is a matter of fact. In his second letter he is satisfied to rely upon "a man who has been trained." The efficacy of "training" uncapped by recognised qualification must remain a matter of opinion, and neither gives to the client the safeguard to which he is entitled nor to the person so "trained" the "status" which he requires.

A LONDON CHARTERED QUANTITY SURVEYOR.

Ludgate Bridge Report.

The Bridge House Estates Committee of the Corporation of London, which met on Monday at the Guildhall under the presidency of the chairman, Mr. H. Weber Brown, adopted the report of its sub-committee on Ludgate Bridge. The report is unfavourable, the committee declaring that the bridge suggested by the Royal Commission on Cross-River Traffic in substitution for the projected St. Paul's Bridge would be "unsuitable in its route and impossible to carry out at anything like the cost indicated in the Commission's report.

"The Commission admit the necessity of another bridge within the confines of the City, and we have examined their proposal with every desire to adopt a suitable alternative to that already approved by Parliament, if it will afford real relief to the daily increasing traffic in the City; but we can only regard the Ludgate Bridge as hastily conceived, unsuitable in its route, and impossible to carry out at anything like the cost indicated in the Commisssion's Report, and we recommend the Court not to adopt it."

The whole matter will come up on this report at an early meeting of the Court of Common Council in the New Year.

Design for Station Building, Muri, India.

This design has been prepared for the proposed station building at Muri, a junction on the Bengal-Nagpur railway system. The walls will be constructed of brick and the roof covered with Raneegunge tiles. The architect for the work is Mr. Bernard Matthews, F.R.I.B.A., architect to the railway company.

St. Oswald's, Ashton-in-Makerfield.

This church is being erected at a colliery village near Wigan, on a site which was given, with ten acres of land, by Lord Gerrard. The church is in the domed Norman style, and is entirely of stone, inside and out. The stone is partly from Birchover, Derbyshire, by Messrs. Ackroyd, and partly from Parbold, by Mr. Finch. It is worked all in the Norman manner, tool marks being left and no fine dressing attempted. The church is being built by Mr. Percy Howe, a master mason, and his brothers, with the assistance of ordinary masons. All the detail and the mouldings, capitals, columns, and bases have been evolved for the work by the architect. Very few detailed drawings have been made, everything being set out full-size on the job. The method adopted is, in the opinion of the architect, as near an approach to the method of mediæval craftsmen as one can get under modern conditions. Hardly any two details are similar, yet all conform to the style in which the church is built. Mr. J. Sydney Brocklesby, F.R.I.B.A., is the architect.

Houses in Middlesex.

These two houses have been erected from designs by Miss Gertrude Leverkus, A.R.I.B.A. One, at Rickmansworth, has an L-shaped plan, and has been built by Mr. Percy Jaggard, of Bushey. The other, at Pinner, has been built by Mr. Frederick Gurney, of Pinner.

The Rubber Exchange.

This building is at 7, Mincing-lane, E.C.3, and is devoted to the exchange of rubber products. It was commenced in 1924, and finished in the present year. The interior has been kept very simple, pilasters and cornices having been formed of fibrous plaster, enclosing structural steel and brickwork. The telephone boxes and other woodwork have been executed in mahogany. Lighting is provided by eight "Doric" pendants, and ventilation is arranged by means of three electric exhaust fans drawing from the roof, and supplied with fresh air from the front windows. The plaster work is finished in French grey and white, and the heating is by radiators, concealed behind the seats.

The architect was Mr. R. Langton Cole, F.R.I.B.A. The general contractors were Messrs. Killby & Gayford, Ltd. The rubber floor was supplied by the India Rubber and Gutta Percha Co., and the heating by Rosser & Russell, Ltd.

Flats, King's-road, Chelsea.

These buildings are in course of erection from the designs of Mr. C. H. Roberts, A.R.I.B.A.

The flats have a bedroom, living-room and bath-room. The kitchenette has an enclosed sink and gas grill. The houses have pantile roofs, and the elevations are of stuc with jalousies.

Students' Drawings.

The drawings illustrated in this issue represent the work of students at the Northern Polytechnic School of Architecture completed during the session 1926-27. They are typical examples of the work of the day and evening schools. The drawing by Mr. Lawrance is that of a first-year student, those by Mr. Oakes and Mr. Clark work of second-year students, and those by Mr. Rayner work of an evening student.

Cottages, Beacon Hall, Benenden, Kent.

This pair of cottages, built for the M. H. Sands Trustees, occupies an elevated and commanding site with a southern aspect. The prevalence of strong south-west winds made simplicity of design an essential. The walls are of brickwork, 11 in. thick, built hollow, and covered with rough cast, finished pure white. The plinth and chimney are built of faced multi-coloured bricks, and the roof is covered with "Rosemary" tiles with purpose-made hips. Steel casement windows are used throughout. The sewage is disposed of by a cesspit and filter beds. These cottages were made to comply with the subsidy regulations.

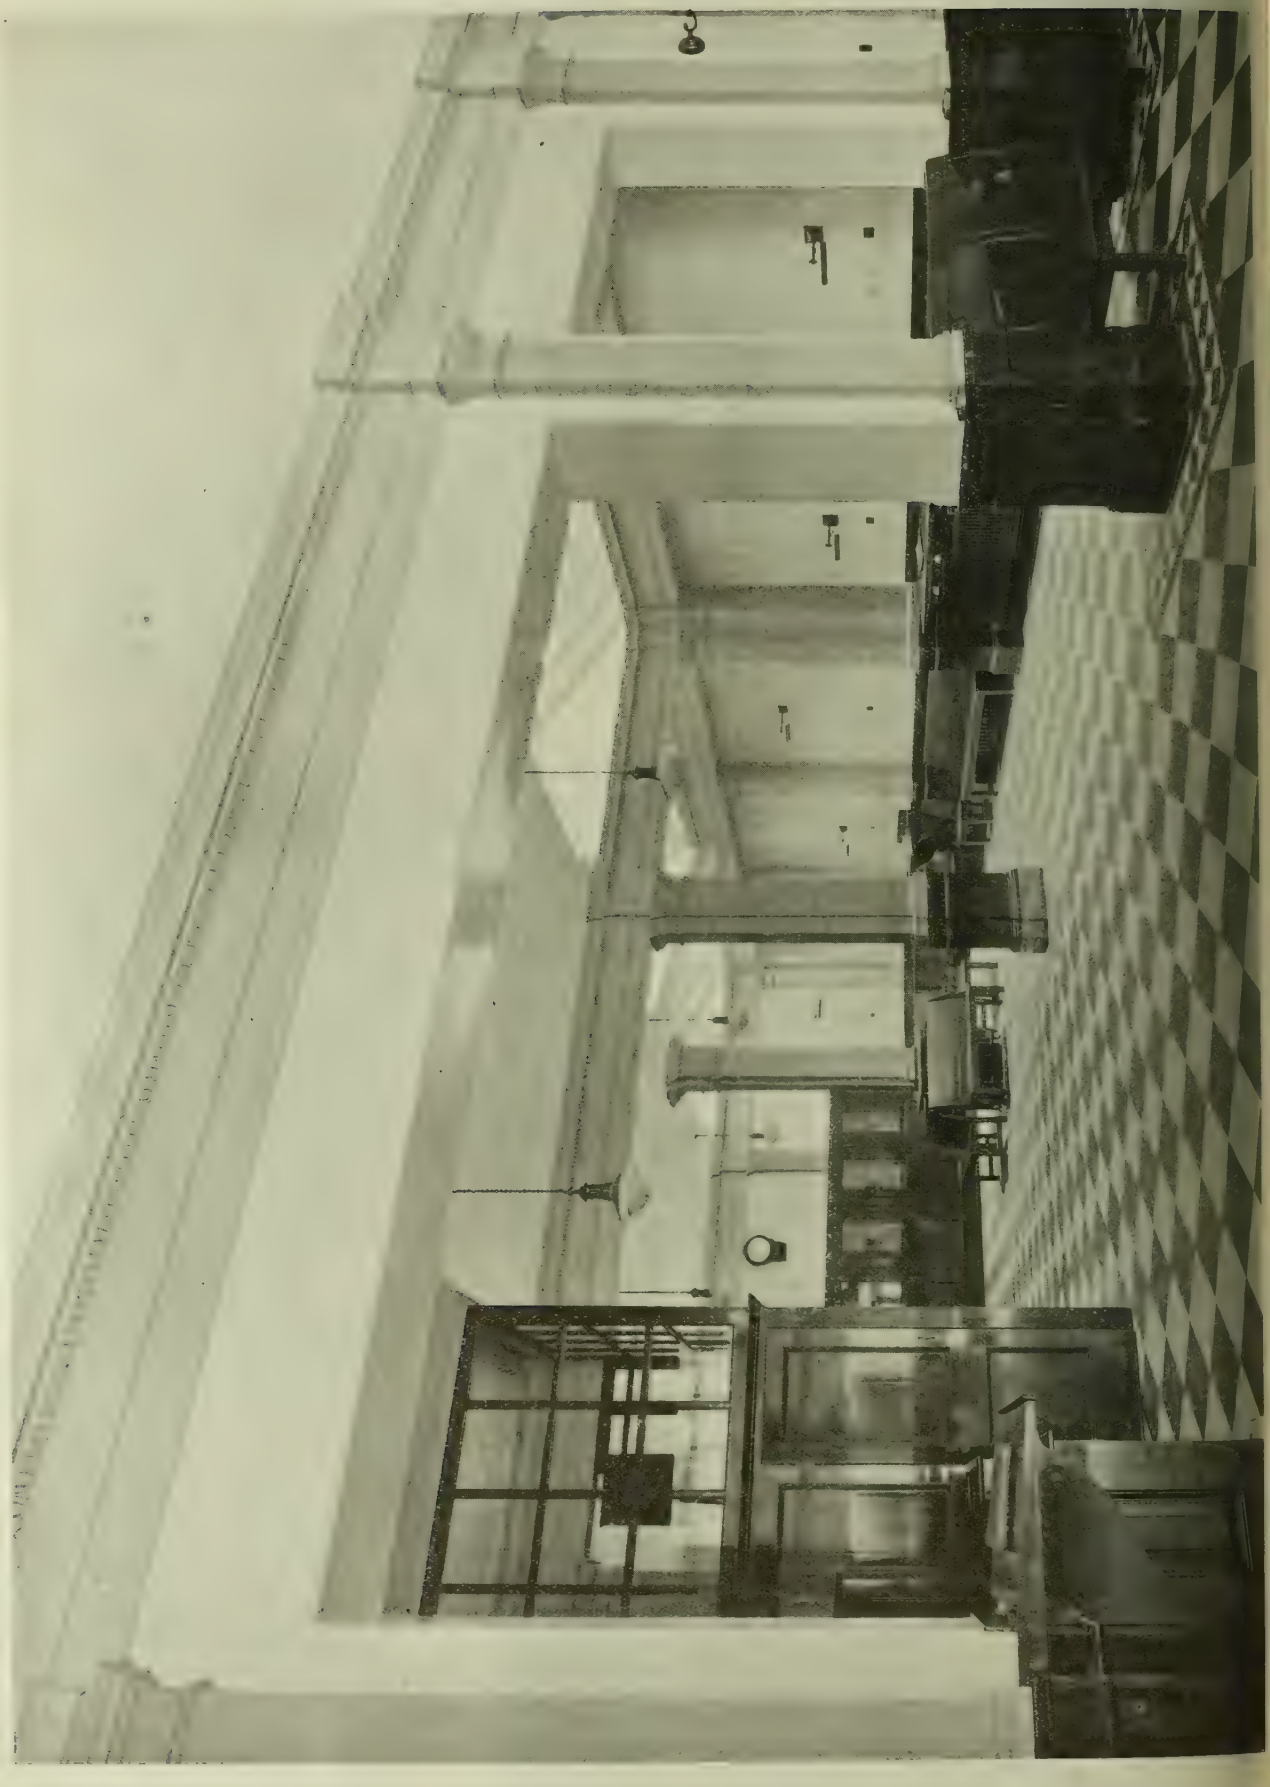
Mr. Sidney Toy, F.R.I.B.A., was the architect, and Mr. W. P. Woodgate, High Halden, Kent, the builder.

St. Bride's Church.

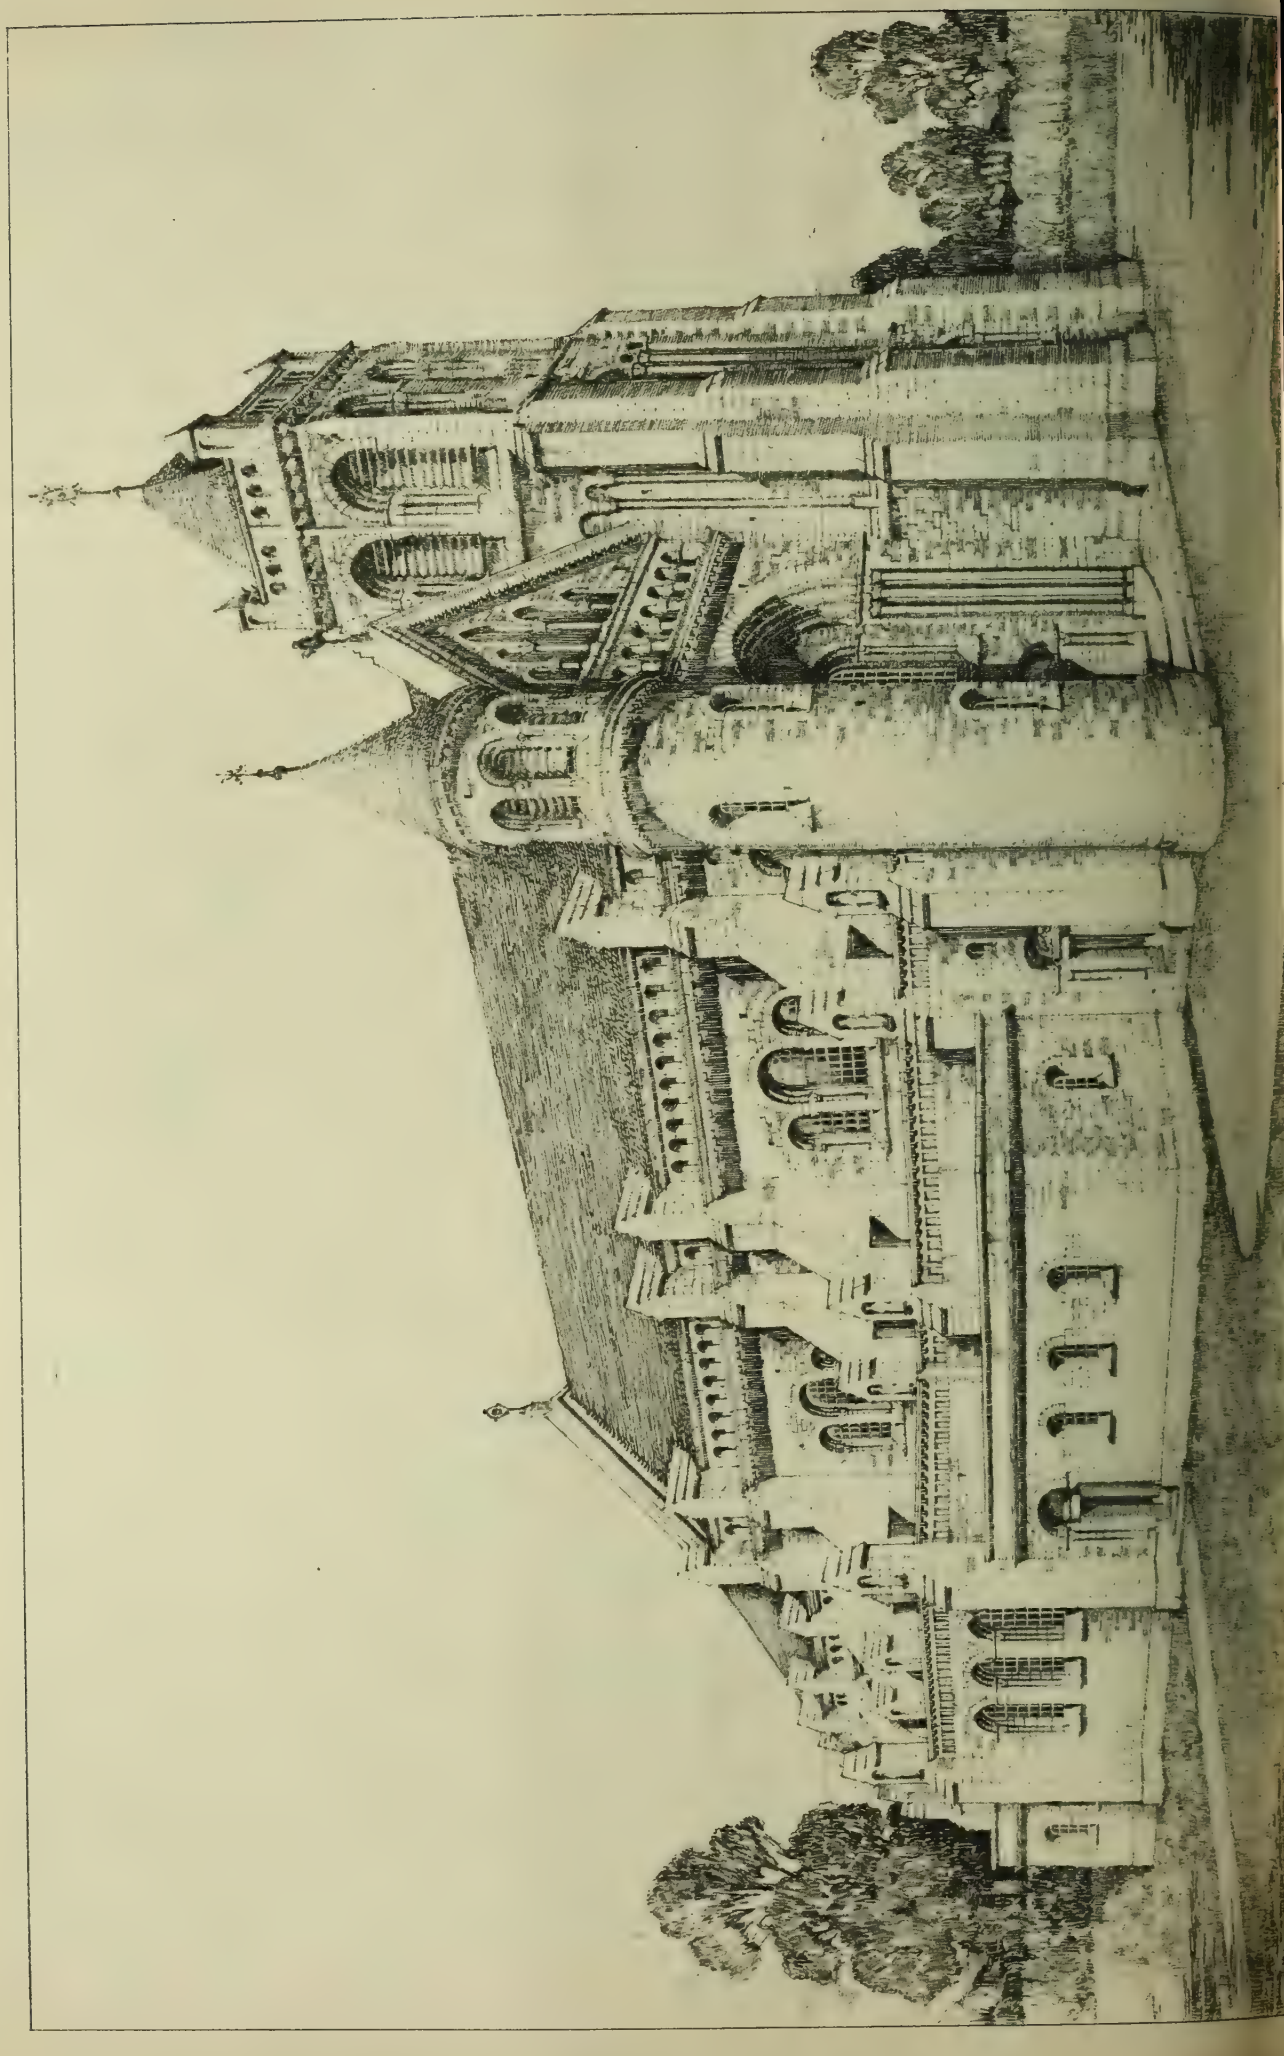
As part of the scheme of redecoration of St. Bride's Church, Fleet-street, a remodelling of the existing altar and reredos has been designed by Messrs. Richardson & Gill, FF.R.I.B.A., as illustrated in this issue. We also give a page of measured drawings of the church by Mr. C. W. J. Smeed, University College School of Architecture.

Plough-road Rehousing Scheme, Battersea.

This scheme comprises 11 blocks of six dwellings each, and the first block was erected on a vacant site on the south side of Britannia-place. Old houses were then demolished and a second block was commenced, and when this is completed more houses will be demolished and another block erected. The dwellings are fitted with electric light and electric cookers, and outbuildings give accommodation for prams and fuel. The walls are of London stocks, the upper floors of concrete covered with magnesite composition, and the roof of green slates. The whole of the work is being carried out by the Works Department of the Battersea Borough Council.



Messrs. T. W. A. Hayward, M.Inst.C.E., and H. Hyams, F.R.I.B.A., are jointly responsible for the scheme.



Department of Architecture, Northern Polytechnic.

THE TOWN PLANNING INSTITUTE

G. MONTAGU HARRIS (President) took ir at the meeting of the Institute, Caxton Hall, Westminster, on Decem- when Dr. R. Schmidt (Director of anning for the Ruhr Region) was to ad a paper on "Regional Planning Ruhr District." Owing to his being to get over by aeroplane the paper d by Mr. G. L. Nayler.

chmidt, in the course of his paper, methods of modern technical arts lustries had given rise to such an e development of the seats of pro- and the means of communication e works created by them often ex- over several administrative areas. hese circumstances it had been found st every industrial country that this ment led to difficulties which could solved by a broadcast planning for division of the area appropriate for sent economic life. It was in the strict that they saw the impossibility plying with the requirements of the nomic situation with regard to de- nt questions on the basis of the exist- eral law. Although a few town dis- were eventually still able, compared e rural communities, to gain a certain y by the so-called zoning of land for ial purposes, they could not fully the inter-communal and general s of the region, for on one side the between the towns often led to diffi- and, on the other hand, the rural s lying between the towns were not not willing, to co-operate in the same towards the accomplishment of a idea, the powers of a rural council heriff) being limited, while the largest of authority lay with the rural com- s, where special interests were strongly nted. An inconvenience for the manu- ng industry on the Ruhr was also the at the economic region that formed a in itself was divided between various strative unities of a higher order. In o less than three Government board nts and two provincial administrations isdiction in the Ruhr district. Under conditions the whole planning forma- n the Ruhr district had, since about ome to life haphazard. Means of com- tion, workshops, mines with their for by-products, residential districts en spaces had proved detrimental to ment. These circumstances became in le at the end of the European war to the fact that, after taking exten- ad valuable regions of production on rders of Germany out of the influence German economic system, the manu- ng district on the Ruhr had to deal new economical problems that claimed rface of the district to a greater than hitherto, because in consideration rising extra demand for ground, still extensive works became necessary nly in the older parts of the district so around its borders. In view of the ty to give economic life to a district existence was almost entirely based on nd iron led to the formation of a com- association with proper powers in this t, the so-called Regional Planning Fede- of the Ruhr Coal Mining District. It onstituted by law of May 5, 1920. It self-governing corporate body. Its part organisation provided for the par- ion of the communal and the workers' ities in the management of its tasks. rincipal executive organ was called the ation Assembly. It consisted of 176 ers; that was to say, 88 members of unty boroughs and rural circles and 88 entatives of the joint committee of em- s and employees. This assembly deter- the lines of guidance for the activities Federation. The current business was e hands of the Federation Executive. ting of 17 members, that was to say, embers of the Federation Association, distributed among manufacturing and administration interests on similar lines, as the Federation Assembly, under the control of the Federation Director. The matters dealt with by the Federation were the problems of traffic, housing, the provision and maintenance of open spaces, etc. One of the duties of the Federation was the creation of a unified road-organism for the through-traffic in the manufacturing district. By decision of its executive, it could demarcate the roads that it deemed convenient. The uniform system of thoroughfares provided by the Federation had a length of about 1,350 kilometres, 600 kilometres of which were provincial roads. At present a thoroughfare of 104 kilometres in length was being built. This road was designed to meet the requirements of modern motor-car traffic by avoiding as far as possible the centres of towns with their narrow streets and wasteful slopes. It had been discussed with the competent representatives of industry, so that the cutting of coherent economic territories was absolutely avoided. Existing industries could therefore expand without being separated from the existing plants. Another essential task of the Federation was its right to amalgamate the inter-communal light railway traffic. In the Ruhr district there were 37 different tramway companies in competition with each other. The Federation had been successful in bringing about working associations of neighbouring companies and in linking up neighbouring communal systems. Furthermore, the interference of the Federation led to a simplification of the tracing of the lines. The enlargement of the State railway system was likewise a subject for the co-operation of the Federation, an important factor indeed, as the original manner of development had often been an obstacle to the present systematic progress. Not only the State railways but also the administrative bodies for the building of tramways and light railways, as well as waterways, had made a move to demarcate traffic arteries. The length of the traffic arteries that had hitherto been demarcated was 450 kilometres. The right to create traffic zones by their demarcation extended also to aerodromes.

A second big task of the Federation referred to was its activities for the building of homes. In this the Federation put in the foreground hygienic conditions as well as economic ones. The site of the habitation zones had so to be chosen that the employed had their homes at a reasonable distance from the works and that every home built so that it could promote the health and recreation of its occupier.

A further duty of the Federation that was in close connection with the housing problem was the provision of inter-communal open spaces. The Federation had the right to demarcate the open spaces and thus to secure their retention; then the use for building purposes was dependent upon the assent of the Federation. The open spaces scheme of the Federation could only be regarded as rigid in so far as it comprised the woods, parks and free spaces that were absolutely necessary to public health. The parts falling over this limit could, upon the decision of the Federation organs, be released again for other economical purposes, and this reduction could be compensated with other sites. This open-space policy was a remarkable aid to economy, as experience proved that sufficiently extensive open spaces prevented damage to the public health, and this led to protecting industrial works from the expense for attendance and care, etc., of patients. The concentration and uniform representation of the problems of industry that had to be solved by this district led to the working out of general sub-division plans of the whole district and of its separate parts in an outline form, known to the Federation as the "economic plan." The different parts of the land were here outlined according to their significance for the workers' life in consultation with the factors of industry. Site and extension of the actual and future working places, traffic arrangements, residential zones and recreation grounds, as well as the agricultural lands that were to be maintained, were, to begin with, generally demarcated. The plan avoided, of course, the fixing of details, as the actual development could not be fully foreseen. The leaders of industry considered these plans to be of great value to the manufacturing interests. From the economic point of view this early planning meant a big saving. The industrial plan was not dependent on political limits, although a change of the communal borders in consideration of its results seemed sometimes desirable. The essential end and aim of these plans was to prepare a movable scheme of widespread building zones contrasting with the centralised development of the large cities which caused organic disorder of traffic, public health and the other conditions of human life. In carrying out its tasks the Regional Planning Federation had likewise frequently a mutual intercourse with the English professional circles and from their more recent publications on these problems it had received many valuable suggestions.

Sir R. Paget, proposing a vote of thanks to the author, said the whole of the vast area had been placed under the control of the men best fitted to deal with it, which was a most democratic thing to do. He could not help thinking that if in this country the communities would find the right man and give him a free hand for a period of years they would be likely to get much better results.

Mr. Barry Parker said he believed the Ruhr was the only instance where real authority and power were given to anyone carrying out a regional scheme. When he was at work at Oporto he was greatly helped by the system of rating. There every property owner assessed his property for rating, but there was a proviso that the local authority could take over the property at the capitalised value of the assessment. Thus, if a man under-estimated his property the local authority might take it over, and if he over-estimated it he paid more in rates.

Mr. Herbert Morrison said he had visited the Ruhr in connection with investigations into municipal government, and had met Dr. Schmidt. What struck a traveller was the absence of any indication that the district was a mining area, which was very different from things in this country. But the system under which the Ruhr was being dealt with could not happen in this country. Dr. Schmidt would not last a month as an officer of the London County Council nor would he be tolerated in the Civil Service. The Ruhr problem reminded him of the work they were beginning on the Greater London Joint Town-Planning Committee. They might suggest things on that Committee, but there were 130 separate local authorities in the area, and they could do as they liked.

Mr. Raymond Unwin pointed out that Dr. Schmidt had made up his mind that traffic routes should be traffic routes. He laid routes down definitely and tried to prevent their being used in connection with residential and developed areas. In this country they made main roads with banks and cuttings which were very inconvenient for development, but took no step to secure that ultimately they would not get a lot of little cross-roads coming in, which largely destroyed the effectiveness of the main roads for traffic purposes. Greater decision was called for in this matter.

Mr. H. V. Lanchester asked if Dr. Schmidt had laid down any definite scheme for permanent open spaces. So far he had only spoken of 38 per cent. of the land being reserved.

Mr. G. L. Pepler said it did not appear that Dr. Schmidt had made any provision with regard to derelict towns. In this country when housing conditions reached normality they would have towns with larger populations than could be supported. Then in this country they found people loath to move into the new houses in a mining village, and

he would like to know if, besides building houses, the Federation provided for the cultural and amusement wants of the people. There was also the question of finance which had not been dealt with.

The President said no one could build in Germany without obtaining the permission of the police authority, and the only difference in the Ruhr was that the police authority was in the Federation. That being so, the Federation could base its action on whether or not it would allow a person to build. When the Federation said it would reserve 38 per cent. of the land for open spaces it meant that it refused permission to build on that land. Some day the Federation might buy the land, but a refusal to permit building did not involve the payment of any compensation. In the Town-Planning Bill before the Prussian Parliament compensation was provided for in certain cases, and the German Association of Municipal Corporations opposed this as being reactionary and opposed to the whole system of local government.

LAW REPORT

ARCHITECT'S ACTION FOR RECOVERY OF FEES.

IN Bloomsbury County Court on December 19, before Mr. Justice Hill Kelly, Mr. Sydney White Cranfield, F.R.I.B.A., of 7, Bedford-square, W.C. 1, sought to recover from Mr. Frank Allwright, retired builder, of Broadstairs, fees said to be due in respect of plans prepared and specifications got out for a bungalow proposed to be built by Mr. Allwright at Broadstairs.

The case, as put by the plaintiff, was that he, in response to a telephone message, called on the defendant, Mr. Allwright, who produced a rough plan and said that he wanted this plan worked up. Plaintiff reported later that this was impossible, as the plan was unworkable, and so, acting on instructions, prepared fresh plans, on the block plan of the site that had been handed him. When plaintiff asked whether defendant would like the site plan checked by the site, he was told it was not necessary. On June 27, plaintiff saw defendant at the latter's flat, when defendant was in a great hurry to complete the drawings, as he, the defendant, wished to get out the specifications. The plaintiff then promised to hurry on the drawings, and suggested that he should get out the specifications. To this he received what he took to be tacit consent. On July 4, defendant wrote that he did not wish quantities taken out by an outside person. Finally, plaintiff and defendant met, when the latter announced that the plan had fallen through, as the block plan—not tallying with the site as it actually was—did not allow of a house such as plaintiff had designed if a necessary stipulation as to a 12 ft. garage approach was allowed for. Defendant later sent a cheque for £25 in settlement of fees, which plaintiff returned, together with a copy of the R.I.B.A. schedule of fees, saying that £25 was not adequate payment for the work done. The estimated cost of erecting the proposed cottage was put at £2,500. Plaintiff claimed £100 as fair remuneration. In support of this, evidence was given by Mr. C. A. Farey, A.R.I.BA., Mr. W. C. Inman, L.R.I.B.A., Mr. William Gillbee Scott, F.R.I.B.A., and Mr. John Douglas Scott, A.R.I.B.A

For the defence, Mr. Frank Allwright gave evidence that he asked plaintiff "to touch up" the elevation of the house he had planned. When the plaintiff said the plan was unworkable and proposed setting about a fresh design, he said: "Go ahead." Defendant stated that he expressly said that the proposed bungalow was not to cost more than £2,000, and denied that he had at any time given instructions to prepare specifications. He himself could have prepared them better than plaintiff, or, for that matter, any other architect.

Mr. John Batty, employed by the L.M. and S. Railway, called to give evidence for the defence, said that for preparing an elevation for an interior already planned, £25 would be an ample payment. For a new set of plans, with notes from which specifications might be got out, he considered from 50 to 60 guineas adequate.

In giving his decision, His Honour the Judge said that although there was some conflict of evidence, as was often the case when business was conducted by interview, he felt he had to believe the plaintiff's evidence when he said that he was told he could take the block plan as being correct, for the reason that at the commencement of affairs, on the defendant's own showing, the plaintiff was asked only "to touch up the elevation." The plaintiff subsequently was told to "go ahead" when he proposed drawing up new plans. This threw a very different light on the implied negligence of the plaintiff. Regarding the preparation of specifications, plaintiff had said that at the meeting on June 27 he had received the defendant's "tacit consent" to such preparation. That could not be accepted as evidence, especially as in a reply to the defendant's letter of July 4 plaintiff had apologised for having mistaken defendant's meaning. It had been put forward, continued His Honour, that Clause 5 (a) or 5 (b) of the R.I.B.A. Scale of Professional Charges should apply. He felt not, as the work carried out by plaintiff was something more than stipulated in Clause 5 (a), and less than laid down in 5 (b). In view of the evidence received from either side, he had to decide what was fair remuneration for the work rightfully undertaken, and that remuneration he would fix at 60 guineas, with costs.

PILING IN STRUCTURAL ENGINEERING

MR. M. J. MCCARTHY, A.M.Inst.C.E., M.I.Struct.E., in his lecture on this subject, read before the Institution of Structural Engineers, dealt with some methods of carrying out piling. One of the most modern, he said, was that known as the Vibro system, invented by Mr. A. Hiley, and in which were utilised to a very marked degree the laws governing earth and plastic concrete pressures and the kinetic effects of the hammer blow actuated by steam power. In the Vibro system a steel tube with shoe was driven into the ground, filled with concrete, then withdrawn by a series of upward and downward blows, the latter being cushioned. The single-acting hammer could impart to the tube an acceleration of approximately 130 ft. per second, but as the frictional hold of the concrete was insufficient to overcome its inertia, the concrete remained stationary, and so became deposited, layer upon layer, with each upward stroke of the hammer and tube. Friction within the downward-moving tube ensured effective ramming of the deposited concrete. The characteristically high values of frictional resistance against upward movement of the semi-fluid concrete within a long tube had for the first time been brought into practical use in this invention. The hammer was readily converted for use in extracting the Vibro tube and giving a tamping movement. The extracting attachment consisted of two steel links, the lower ends being attached to lugs in the tube head casting and suspended from tackles at the top from the frame head sheaves, Belleville springs being fitted as shock absorbers, so as to cause the downward blow of the hammer on the tube to be a tamping, not a driving blow. The stroke of the hammer when extracting was limited to 18 in. and the action was automatic, 80 blows per minute being obtained. The procedure in making a Vibro concrete pile was as follows: The cast-iron conical shoe was placed in position and the tube lowered from the pile driving frame. The single-acting hammer was made to drive the tube with shoe until a firm base was met; the mixed concrete was now placed in the tube, which was then withdrawn by the hammer rigged with the extracting links, and during withdrawal a ten kept by the winchman on the rop downward stroke of the hammer tan tube, the lower tamping ring of whi the concrete downwards and outwa solidating and keying it firmly to rounding soil. Reinforcement, if des dropped down the tube before shoo concrete. From tests carried out it stated that a Vibro concrete pile wo a permanent load of 50 tons withou settlement.

SOUTH SHIELDS MA BUILDERS

MR. A. RIDLEY (President) occu chair at the annual dinner of the Sout Master Builders' Association, held at the Royal Hotel. There was a large ance, comprising members of the and allied trades, and also of mem officials of the South Shields Corporat local architects. Proposing the toas Building Trade," Alderman Taylor regarded the efforts of the local buildi as quite the most important factor in pansion of the rateable value of th which now stood at £600,000. Build done much, by means of the erection sidy houses, to improve the town subsidy was now reduced, but he wa opinion that they now had enough type of house. The building of subsid had reached its limit, but he thou Government should continue to give a on a better class of house. He was opinion that Mr. Neville Chamberlain the present time seriously considering visability of doing something along th Speaking from the viewpoint of the the speaker said that he was up again formed for the purpose of keeping price of materials. He strongly urg there should be open markets for all cl material. Competition was the only bring prices down. Mr. J. S. Ea President of the Northern Counties Fed responded, as also did the President, a W. H. Hope, of Sunderland, Secretary Northern Counties organisation.

Employment in the Building Tra

Employment during November, sa *Ministry of Labour Gazette* showed a seasonal decline; it was generally quie skilled operatives and slack on the who unskilled workers; the general decline a all occupations, except slaters, but wa pronounced in the painting and dec section. Unfavourable weather con hampered outside work and caused an ciable amount of lost time. As compare November, 1926, employment was not s with the various classes of skilled w other than painters, with whom, a builders' labourers, it was somewhat As regards individual occupations, e ment again showed a marked declin plasterers and was moderate or slack whole; it also declined with brick masons and carpenters and was ge quiet; with slaters it showed some im ment and was fairly good at most cent was fair, on the whole, with plumbers seasonal decline with painters continue employment was slack; it was also sla the whole, with tradesmen's labourers.

Country House Fire.

Early last Friday morning Stoke some seven miles from Hereford, one finest seventeenth-century country house destroyed by fire. The house contai number of treasures, which could r saved—a fine painted ceiling in the hall by Sir James Thornhill, and a noble st which had only just been restored—b owner, Mr. Paul Foley, was able to sav of his valuable works of art, a great books, and some of his furniture. The of the fire is unknown.

QUANTITY SURVEYING AND THE ARCHITECT IN U.S.A.

American Institute of Quantity Sur- formed a little more than a year ago, ade considerable efforts to introduce e United States a system of quantity ng on the lines of that which exists in ntry. We have published in recent xtracts from propaganda addresses on ject by prominent American quantity rs, and we now give some excerpts further address delivered recently at ond Annual Convention of the Insti- Washington, by Mr. C. L. Weeks.

intelligence of the surveyor concen- on the problem of bidding methods, e speaker, would not only eliminate ion of estimating, with consequent re- of construction costs to the owner, uld also bring about many other im- nts in practice. One of the most nt direct benefits to the architect was plification of both plans and specifica At the present time it must be acknow- that in the unsuccessful and vain of the architect to provide a specific ent of purchase they were often un- rily elaborate, complicated, and full ition. Surveys were bound to bring in competition, not only among archi- eeking to obtain commissions from tive owners, but also among contrac- ding on work. The architect who was and able to give genuine service would he whole-hearted support of the sur- who would accept only plans and speci- s that were clear, practical and Special privileges, handing out archi- commissions to the favoured incom- would meet with a stumbling-block. would eliminate squabbling over and disputes with contractors. Con- could be regulated by a schedule of overing extras, by the surveyor in all of dispute, and thus bring about harmony between the contracting parties. The architect should avail himself of the opportunity offered him by the surveyor to correct and perfect his drawings and specifications, through having his attention called to errors and omissions which were otherwise difficult to detect. He should realise that the practical object of his drawings and specifications was to provide a definite and specific instrument for the purpose of determining the exact quantity of materials and labour for a structure.

The architect must realise that the criticism of the contractor was liable to be prompted by self-interest. It was true that there had been a more or less organised campaign carried on by the contractors to get—

(*a*) More distinct drawings and elimination of pencil drawings in too small a scale to be clearly legible.

(*b*) More drawings and more details in order to show work clearly.

(*c*) Greater number of figures of dimension, and avoidance of inaccuracy in figures of dimension by more careful checking.

(*d*) Better engineering, both structural and mechanical.

(*e*) More complete and more adequate specifications.

The architect must realise, however, that special stress was laid on the things that would tend to make the contractor's work easier and more profitable, such as the replacement of small-scale and indistinct pencil drawings, increase of time in estimating, reduction of the number of alternate bids requested, etc., than in those things that would tend to provide an indisputable instrument of purchase.

In order to encourage the competent surveyor to stay in the occupation of surveying as a professional engineer in the service of the public, rather than to be absorbed by the contracting business, he must have adequate remuneration; therefore, it was the architect's duty to encourage the employment of the professional surveyor in the owner's interest, especially as it was not necessary for that employment to cost the architect one dollar. It should and might be paid for directly by the owner, and even when the contractor employed the surveyor it was the owner who paid his salary or fee indirectly, but with the difference that he did not receive the direct benefit of his labour. The architect could and should encourage the direct employment of the surveyor for preliminary estimates, expert services in legal disputes or in arbitration, including both controversy between owner and contractor and condemnation proceedings. Competent surveyors were now available in all parts of the country.

The D.I.A. Quarterly.

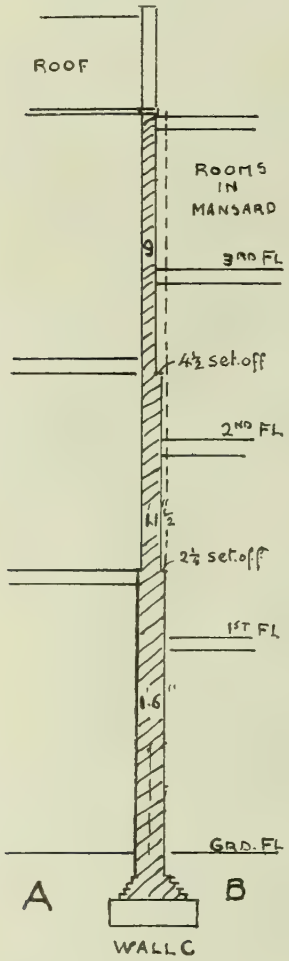
This little publication, which has recently made its appearance, is the first issue of the *Journal of the Design and Industries Association*. This Association, which has headquarters at 6, Queen-square, W.C.1, has as its special aim the encouragement of sane industrial design and good workmanship in mass production. Whilst it is not claimed that mass production is likely to produce art, the individual expression of man's joy in work, it is felt that in both great and small industries the human element is to be fostered, in that this element enters into every large-scale industry far more than many critics will allow.

The Quarterly is a neatly produced and well-printed publication, lightened by a number of illustrations of craftwork. While published primarily for the benefit of members of the Association, it may be obtained (price 5d. post free) by anyone interested in the encouragement of good workmanship based on excellence of design and soundness of material.

MESSRS. MOWBRAY GREEN & HOLLIER, Architects.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.



May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Party Wall Rights.

Sir,—A and B are adjoining owners. B is building owner and wants to acquire party-wall rights in wall C.

B is willing to pay half the cost of party-wall C. A is agreeable to this.

A has built to the extent of his boundary and owns the space above ground floor indicated by dotted line; he wants B to pay for the extra space gained (in addition to paying for half the wall) and wants B to pay for the space on which the 9 in. (half wall) stands on ground floor also in addition to cost of the

9 in. of wall. But B contends that, in paying for the half wall on ground floor, and paying for half the wall above, he becomes owner of the space gained inside the dotted line.

If he is not buying the space on all the floors, but only the right to use the wall as a party wall, what would be a fair price to pay for the space gained—he gains none on ground floor—2¼ in. above the first set-off and 6¾ in. above the second set-off.

B paid £25 a foot for his frontage.

A says, with an eye to the future, that he may want to pull down his building and erect a much higher one, and may want, correspondingly, to thicken his wall; therefore the space within the dotted line is valuable to him.

Interested.

Scaling on Glazed Brick Walls.

Sir,—Scaling has occurred on glazed brick walls in a small public slipper bath. The walls are built in stock brick in cement mortar lined internally with ivory glazed bricks, pointed up in Atlas White cement. First signs of scaling of the glaze were noticed about three months after the building had been erected, and the scaling has continued to spread ever since. The scaling only occurs around the edge of the glazed bricks next the joints.

Can any reader, who has experienced similar trouble, offer an explanation for this curious fault developing? Naturally, the walls of this type of building are subject to a fair amount of steam and wet in the form of condensation.

Puzzled.

Zinc Roof and District Surveyor.

[Reply to "Practice," December 9.]

Sir,—To take this matter further, I am informed that the question turns on the meaning of the word "repair." Does a builder "repair" a roof when new materials are wholly used for a complete recovering? In such a case, is it a new covering entailing supervision of scheduled materials calling for inspection by a district surveyor?

Although the work of renewing a covering may be regarded as a repair, yet on the assumption that only a change of form and materials implies a new job, it may be contended that a whole reinstated building, as an exact copy of a previously existing building, is a repair.

Reader.

Condensation on Shop Windows.

[Reply to "Troubled," December 16.]

Sir,—The provision of one or two gas jets in the show windows should remove the cause of the trouble. If central heating is available, a small heating pipe run round at the bottom of the glass front is still better, and less costly in upkeep; but failing an existing heating system the gas jets probably provide the cheapest installation at an upkeep cost which is not very serious.

Heatum.

Housing Acts.

Sir,—Can you inform me whether the Wheatley Act is still in operation, and whether its benefits are available for private enterprise?

Voter.

Copyright

Sir,—To what extent does an architect retain the copyright of his drawings? A set of plans comprises plans of each floor and elevations of each front, among other things. Suppose his floor plans were exactly copied, but the elevations treated entirely differently, would he have ground for action against the copyist? Or, to go further, suppose his ground-floor plan were copied exactly, and one elevation, but the other floors and elevations materially varied, would he then have ground for action?

Jealous.

WEEK IN PARLIAMENT

Westminster, Wednesday.

Rural Housing.

Major Glyn asked the Minister whether, seeing that a large number of rural dwellings could thereby be made sanitary and thoroughly suitable for habitation, he would consider extending the grant to include general repairs to cottages, where considered necessary. At a minimum cost of say £30, and allowing the local authority responsible to reduce the grant to one-half instead of two-thirds?

Mr. Chamberlain said that the question of the extent to which financial assistance under the Housing (Rural Workers) Act, 1926, could be afforded to works of ordinary repairs or upkeep was fully discussed during the passage of the Bill through the House, when it was decided that works of such a nature could only be included for the purposes of assistance where they were incidental to and connected with the reconstruction and improvement of the buildings. He did not think that the proposal of Major Glyn would prove sufficiently attractive to induce landlords to take advantage of it if they were thereby tied up for 20 by the conditions laid down in the A

Major Glyn asked how many dw had up to the present been reconst under the terms of the Housing Workers) Act, in the counties of Berk Oxfordshire, Hampshire, Buckinghan Gloucestershire, and Wiltshire.

Mr. Chamberlain said that retur progress under the Housing Workers) Act, 1926, were obtained terly, and, according to the latest r to September 30 last, no dwellings actually been reconstructed under t in any of the counties referred to. Gloucestershire County Council, ho had received applications for assista respect of the improvement of 14 dwe

A Cobham Scheme.

Mr. Kelly asked the Minister of whether he could now state the result communication with the local author Cobham, Surrey, regarding the inad number of houses built and the rents c for those which had been completed.

Mr. Chamberlain said he understoo the Rural District Council of Epsor already provided 84 houses in the pa Cobham, and it did not appear that were sufficient grounds for declaring th local authority had failed in their d this respect. The determination of the which should be charged for the hous a matter for the local authority.

SOCIETIES AND INSTITUTIONS

R.I.B.A. STATUTORY EXAMINAT

The R.I.B.A. Statutory Examinatio the office of District Surveyor unde London Building Acts, or Building Su under local authorities, will be held R.I.B.A., London, on May 2, 3, and on October 17, 18, and 19, 1928. The dates for receiving applications for adn to the examinations, accompanied by t of £3 3s., are April 11 and October 1 tively. Full particulars of the examin and application forms can be obtainec the Secretary, R.I.B.A., 9, Conduit-W.1.

R.I.B.A. LECTURES ON ARCHITEC FOR WORKERS.

On Wednesday, January 18, 1928 Arthur T. Bolton, F.R.I.B.A., will paper on "The Architecture of Robe James Adam." The paper on the "Ar ture of Provincial France," by Mr. M. Fletcher, F.R.I.B.A., originally fix Wednesday, January 18, was given on nesday, December 14, Mr. Ernest Law, to illness, being unable to deliver his on Hampton Court Palace.

THE INCORPORATED ASSOCIATIO ARCHITECTS AND SURVEYOI

At a meeting of the Council of the Association, held at the Institute, V ham-place, London, Mr. V. A. L A.M.I.C.E., F.I.A.A., of Cirencester elected President for the ensuing yea the following members were elected Presidents, viz.: Major R. I. Tasker, M.P., J.P., L.C.C.; Mr. Charles H. T Mr. Andrew Mather, L.R.I.B.A.; W. H. T. Brewer; Mr. F. G. Sain L.R.I.B.A., M.I.Struct.E.; and M Heath.

THE ROYAL SANITARY INSTITU The Henry Saxon Snell Prize.

The subject given for essays in comp for the Henry Saxon Snell Prize in 19 "Sanitary Accommodation, Appliance Fittings for Hotels and Flats." Act the advice of the adjudicators, the C have awarded the prize of 50 guineas silver medal of the Institute to Mr. H. Clay, A.R.San.I. The adjudicators to commend the essay sent in under the "Commune Bonum," and the Counc made a supplementary award of a medal to the writer of this essay, Mr. R. Sayer, M.R.San.I.

THE BUILDING TRADE

NTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—IX.

venants Restraining Assignment—
(continued).

ur last article we were considering the ecessary in framing covenants against ng, underletting or parting with the ion of premises, and had shown that ords "assign and part with" do not to an underletting, and that expres- lenoting parting with *possession* should erted. A further example of the limi- placed on words in this connection is d by the case Jackson *v.* Simons (1923, 373; *The Builder,* July 27, 1923). the predecessors of the plaintiff had d to the defendant a ground-floor shop term of 21 years, and the lease con- a covenant against "assigning, under- or parting with the demised premises part thereof or parting with or sharing ssession or occupation thereof or any hereof" with the usual provision as sent. The basement of the shop and djoining premises which also belonged plaintiff were in the occupation of a who carried on a night club in them. trance to the night club adjoined the es leased to the defendant, and as the tickets for the night club caused some tion objected to by the police, the tor of the club had entered into an ement with the defendant for the sale tickets in the front part of the de- t's shop, and a movable screen had rected cutting off the front of the shop he sale of tickets was proceeding. £7 was paid for this privilege, and the tickets took place between 10.30 p.m. a.m. About 18 months after this e had been adopted the plaintiff be- ware of it, and soon afterwards com- l an action to recover possession of the es for breach of the above covenant. hat action it was held by Mr. Justice (as he then was) that this did not ute "an underletting or parting with ssession of the premises or any part under the first part of the covenant defendant retained the legal possession whole of the premises and had only l a privilege or licence to use a part same, but it did amount to a "sharing possession of part of the premises," is raised the point whether such a nt was within the exception provided tion 14, subsection (6) of the Convey- Act, 1881. His lordship held that bsection includes a covenant against ng, underletting and parting with the ion or disposing of premises but not nant or condition against sharing the ion and therefore for breach of this nt notice should have been given under 14, subsection (1) and in the absence h notice the action must be dismissed. ay be noticed that the Law of Pro- Act will in no way affect this decision, e same wording is retained in section bsection (8) that existed in subsection the Act of 1881, but the point referred ur last article has to be borne in mind, here the breach of covenant occurs he commencement of the Law of Pro- Act (January 1, 1926), the exception ed by the subsection (8) will not apply otice of breach of a covenant not to underlet part with the possession or of the land leased will have to be nder subsection (1). As it is impor- insert the words "part with the pos- " in order to provide against a sub- of the property which amounts to a hange in occupancy as against a part- th the possession (see our last article. Russell *v.* Beecham) it is no less important to provide against the tenant dealing with a part of the premises as distinguished from the whole, for in the absence of these words of limitation a covenant against assigning, underletting or parting with the possession of "the premises" will not be infringed where part of the premises are thus dealt with (Church *v.* Brown, 1808, 15 Ves. 258; Grove *v.* Portal, 1902, 1 Ch. 727), and per Lord Wrenbury in Chatterton *v.* Terrell (*infra*).

In Chatterton *v.* Terrell (1923, A.C. 578; *The Builder,* December 28, 1923), however, the House of Lords held that where first part of a house had been sublet with consent, and then the remainder had been sublet without the required consent, this was a breach of a covenant "not to assign, underlet or part with the possession of the premises" as the premises as a whole had been parted with by the double operation. This case was distinguished in Roberts *v.* Enlayde (1924, 1 K.B. 335; *The Builder,* December 28, 1924), where the covenant against assigning, demising, underletting, or otherwise parting with the possession of the said premises without consent, contained a provision "Provided that this clause shall not apply to any underletting of the said premises or any part thereof for a term not exceeding three years." The lease had been assigned to the defendant, who on August 13, 1921, without consent sublet a portion of the premises consisting of a cottage, shed and yard to one Turnpenny on a weekly tenancy, and subsequently, equally without consent, sublet the whole of the remainder of the premises to one Woolnough for a term of 21 years. It is to be observed that the covenant contained no restriction on assigning, etc., part of the premises although the proviso mentions underletting "the said premises or any part thereof." The Court of Appeal held that the first underletting for a term less than three years was no breach of the covenant for it was excepted from the covenant by the proviso, whilst the second underletting for a term exceeding three years also was not a breach of the covenant, which only prohibited assigning, underletting, etc., the whole of the premises. It was observed in this case by Lord Justice Atkin that a covenant to be of any real value ought to provide that the lessee shall not underlet the premises or any part thereof.

We must now draw attention to a case, Abrahams *v.* MacFisheries, Ltd. (1925, 2 K.B. 18; *The Builder,* July 31, 1925), which has an important bearing both upon Jackson *v.* Simons, a case we noted at the commencement of this article, and the dictum of Lord Justice Scrutton in Russell *v.* Beecham, which we quoted at the close of our last article. The facts are very voluminous, and will be found in detail in our note of the case, July 31, 1925. The defendants, the MacFisheries Company, were tenants of two shops under a lease which contained a covenant prohibiting assigning, underletting, or parting with possession of the premises or any part of them, and the lease contained a power of re-entry. The defendants were desirous of sub-letting one of the shops and entered into negotiations with a firm of wine merchants, who agreed to take it on a full repairing lease. It was agreed that possession of the premises should be given to the wine merchants in order to allow them to carry out certain repairs, and a cheque was given for rent in advance, but not cashed. It was pointed out by the MacFisheries Company that no repairs could be carried out until a schedule of the same had been submitted to their superior landlord for approval, but when the schedule was handed to the Company they indicated that in their opinion the repairs specified would not require approval by their landlord, and that they could be put in hand, but that it must be understood that should any hitch arise in obtaining the landlord's consent to the sub-letting, surrender of the premises must be made upon request. The landlord refused consent, and the sub-lessees refused to give up possession. In an action by the landlord against the MacFisheries Company to recover possession the Court held that a breach of the covenant had been committed, as the defendants had parted with possession of part of the premises; but then the really important point was raised by the defendants that, as this was a parting with the possession only of a part of the premises demised, section 14 of the Conveyancing Act, 1881 (now section 146 of the Law of Property Act, 1925), applied, and notice should have been given of the breach, for the exception contained in subsection (6) had no application where only a part of the premises are dealt with. The Court held that subsection (6) applies to parting with possession of part of the premises, and therefore no notice of the breach was necessary, and this decision has been followed in the case Carrington Manufacturing Company *v.* Saldin (1925, 133 L.T. 432).

It may be convenient here to note that in Carrington Manufacturing Company *v.* Saldin (*ubi sup.*) the facts as to the breach of covenant were as follows:—In January, 1923, it was agreed between the owner of the property and the defendant that, in consideration of the latter being allowed to take possession of the premises, he would execute a counterpart lease in the form of the agreement. That agreement contained a covenant against assigning, underletting, or parting with the possession of the premises, or any part thereof. The counterpart was executed July, 1923, dating from March 25, 1923, but in the interval, on April 5, the defendant had underlet a portion of the premises without the owner's knowledge. It was held that on April 5 the rights and obligations of the parties were the same in all respects as they would have been had the lease already been executed, and therefore, under the power of re-entry contained in the agreement, possession could be recovered for breach of the covenant, and that subsection (6) of section 14 of the Conveyancing Act, 1881, applied, and notice of the breach was unnecessary.

We may conclude the observations contained in this article, which it will have been seen are addressed to the first portion of the covenants against assigning and have not been concerned with that portion which relates to consent, with a reference to the form of covenant used in Chatterton *v.* Terrell (*ubi sup.*). There, in addition to the usual provisions as to consent, which we shall refer to in our next article, there was a further provision: "And as a condition of such consent the landlord may require the assignee to enter into an agreement with him direct to observe and fulfil all the conditions and obligations of this agreement." Lord Wrenbury pointed out that the assignee is only mentioned in this condition, and not the sub-lessee, for the sub-lessee could not be called upon to enter into an agreement with the head lessor, with whom he has no privity, to fulfil all the conditions and obligations of the principal tenancy—for instance, the obligation to pay the rent reserved by the principal tenancy agreement. Therefore the words in question apply only to an assignee, and have no application to a sub-lessee. Similarly, as we pointed out in our eighth article, an under-lessee is not entitled to sue the assignee of the freehold and leasehold reversions of the premises comprised in

the under-lease in respect of a positive covenant by the head lessor with the original lessee where the latter has not assigned or demised the benefit of such covenant to the under-lessee, South of England Dairies, Ltd. *v.* Baker (1906, 2 Ch. 631). In that case, on the demise of part of a house, the lessee covenanted to pay one-third of the water rate, and the lessor covenanted to pay all rates and taxes except the proportion of the water rate undertaken by the lessee. The lessee sub-demised to the plaintiffs, who, with knowledge of the superior lease, covenanted to pay one-third of the water rate. The freehold reversion and the superior lease subsequently became vested in the defendant. At that time the portion of the premises comprised in the lease and under-lease had been separately assessed, and the defendant refused to pay any of the rates and taxes in respect of that part. The local authority distrained on the plaintiffs, and they sought to recover the sums they had been compelled to pay from the defendant, but the action failed on the ground that there was no privity between the under-lessees and the assigns of the free-hold reversion and the superior lease. An under-lessee of a term less than the term granted by the original lease is not an assign of his lessor.

RENT RESTRICTION: SUBLETTING BY STATUTORY TENANTS

WE may draw attention to a most important decision under the Rent Restriction Acts which relates to the point whether a statutory tenant—that is a tenant under notice to quit—has power to sublet a portion of the premises. The point has arisen again in connection with the recent case Roe *v.* Russell (*Times*, December 16), where a Divisional Court has decided that the tenant has no such right.

The facts of the case appear to be that in 1915 a Mrs. Alders had let a house within the Rent Act to a Mr. Jamieson. In 1919 Mrs. Alders had assigned her interest in the premises to the plaintiff in the action, who in 1921 served a notice to quit on Mr. Jamieson, who thereupon became a statutory tenant. In November, 1925, Mr. Jamieson sublet to the defendant in the action certain rooms in the house. In July, 1926, the plaintiff had obtained an order in the County Court for possession of the whole of the premises as against Mr. Jamieson, who left the premises in May, 1927, leaving the defendant, his sub-tenant, in possession of the rooms he had sublet to him. The present action was brought to obtain possession as against the sub-tenant of these rooms, by ejectment. The County Court Judge made an order for ejectment, and on appeal to a Divisional Court the appeal was dismissed and leave for further appeal was refused. The ground upon which, according to the report, the Court came to this decision was that although for a time it had been believed that section 15, subsection (1) of the Rent Act, 1920, which provides: "A tenant who by virtue of the provisions of this Act retains possession of any dwelling-house to which the Act applies shall so long as he retains possession observe and be entitled to all the terms and conditions of the original contract of tenancy so far as the same are consistent with this Act," conferred upon the statutory tenant the right to sublet (unless restrained by the contract of tenancy), but that that belief had been put an end to by the decision in Keeves *v.* Dean (1924, 1 K.B. 685: *The Builder*, January 25, 1924), where it had been decided that the right to assign, which in the absence of express stipulation to the contrary belongs to a tenant at common law, was not a term or condition of the contract or tenancy of which the statutory limit was entitled to have the benefit, and although in Keeves *v.* Dean the Court expressly declined to determine whether a statutory tenant could sublet, the Court in the case under consideration drew the inference that if a right to assign could not be considered one of the terms or conditions of the original contract of tenancy which a statutory tenant could claim to exercise, the same considerations must apply to the right to sublet. The Court also referred to an unreported decision of a Divisional Court in the case Wheeler *v.* Smith, May 14, 1926, where it was definitely held that a statutory tenant possessed no interest which entitled him to sublet.

There was no restriction against assigning or subletting in the above agreement. The cases are very difficult to follow, and from the report of the above case it does not appear that the attention of the Court was called to Campbell *v.* Lill (*Weekly Notes*, May 1, 1926; *The Builder*, June 25, 1926), a case which was decided by a Divisional Court, but constituted of two Lords Justices, and which unfortunately was not reported in full in the Law Reports. That case differs from the one we are considering in that the action was brought for possession against the tenant, whilst here the proceeding for ejectment, the subject of appeal, were against the sub-tenant, judgment for possession against the tenant having already been given in the County Court, but the facts of the case are very similar. There the plaintiff had in 1915 let a house on a three-years' agreement to the defendant. At the termination of that period the defendant held over as a yearly tenant, but in June, 1920, notice to quit was given to him which expired at Christmas, and after that date it was agreed between the parties that the plaintiff was only in occupation against the will of the landlord as a statutory tenant. The defendant had subsequently sublet a part of the premises, remaining in possession of the rest. There was no restriction against subletting.

The County Court Judge had made an order for possession as against the defendant, but on appeal this order was set aside. The Court, constituted of two Lords Justices, distinguished Keeves *v.* Dean on the ground that there the action was brought against an assignee of a statutory tenant who had assigned after notice to quit, and that although the Court of Appeal had held in that case that a statutory tenant had no right to assign, and therefore the plaintiff had succeeded, that decision had no application to the case before the Court, where, after notice to quit, the tenant had sublet a portion of the premises but remained in possession of the rest of the house, and that the position of the statutory tenant was clearly defined in section 4, subsection (1) (*h*) of the Rent Act, 1923, which must be taken to be exhaustive as to his position. That section provides: "No order or judgment for the recovery of the possession of a dwelling-house to which this Act applies, or for the ejectment of a tenant therefrom, shall be made or given unless (*h*) the tenant, without the consent of the landlord, has at any time after July 31, 1923, assigned or sublet the whole of the dwelling-house or sublet part of the dwelling-house, the remainder being already sublet," and it was held to have no application to this case, because only a part of the house had been sublet.

The Court, in giving this decision, particularly stated that it was not considering the position of the sub-tenant, but only that of the statutory tenant.

It will be observed that in the case we are considering the proceedings were against the sub-tenant, but the ground of the decision was the same as that in Keeves *v.* Dean, that a statutory tenant has no right to sublet; but would the decision have been the same had the case of Campbell *v.* Lill been brought before the Court? That case appears to show that the statutory tenant has a right to sublet within the limits prescribed by section 4, subsection (1) (*h*) of the Act of 1923.

In Keeves *v.* Dean, Lord Justice Bankes said: "I say nothing about subletting, because it may be that a statutory tenant who has sublet part only of the premises which he claims the right to retain and wh occupies is still entitled to the protec the statute."

We can only call attention to the di of reconciling the decisions as reporte

As a matter of principle, we think cision of the Court in Roe *v.* Russel be preferred to that in Campbell *v.* L as we pointed out in our article on th case in our issue of June 25, 1926, it wholly unreasonable that a tenant notice to quit has expired, and who co in possession against the will of his l under the protection of the Rent Acts, be able to deal with part of the prop such a way that it will remain subject provisions of the Rent Acts even a himself has either left or been ejecte the premises. See section 15, subsect of the Act of 1920, and section 2, sul (1) of the Act of 1923.

THE PLASTERING CR DISPUTE

REGARDING the dispute in the Nor Coast Area by the Northern Counties B Trades Employers' Federation, we ta following from a pamphlet issued by th Joint Council of the Plastering Indu "The National Association of Plas Granolithic and Cement Workers, as m of the National Wages and Conditions found themselves in a minority, the ma cumbersome, that time was limited for appertaining peculiar to their craft, an dealt with were done so by those w little knowledge or sympathy with th dustry. Consequently they tenderec notice to the National Wages and Cor Council on September 16, 1924, this w firmed by the latter on October 14, 19 expired in March, 1925. The Op Plasterers tried several times for a con with the National Federation of B Trades Employers, and were refused they were prepared to accept a N settlement, on an 'all-in' policy. mately negotiations broke down. In 1927, the Operative Plasterers gave months' notice for an advance of wage per hour, basing their claim on the fa wages were being paid anything from up to 2s 6d. per hour, and proving sively that several builders were pay and 2s. 6d. Disagreement took place area, and it was referred to the Nationa Council for their findings. This was g July 20, that the wages of the Nor Coast for Operative Plasterers be 1s. 9 hour and to take effect as and from S ber 1, 1927. Any kind of wages from were being paid to the Operative Pl in this area from 1920. These induc were entirely reprehensible and were to be paid by members of the Northern ties Building Trades Federation, neit latter nor its National body being handle the situation, notwithstanding r appeals by Master Plasterers of this a which there are letters to prove. From sources it has been stated that build now able to obtain men at 1s. 8d. pe notwithstanding that there is conclusiv by written statement from Operatives packets verified, right up to the week November 4, 1927, 1s. 10d. and 2s. pe was being paid in this area by member Northern Counties Builders' Fed The situation that has now arisen is t the Master Plasterers who were pa the National and Area Joint Council tution, who dishonoured their pledge cepting and agreeing to abide by the N Counties Building Trade Federation's tion, which gave the latter the sole r negotiate terms with the Operatives. i tive of whether they employed operati terers or not, and thus brought abo chaotic conditions that existed prior formation of the National Joint Cou the Plastering Industry."

IE LANDLORD AND NANT (No. 2) BILL

THE HOUSE OF LORDS.

Landlord and Tenant Bill did not re- very favourable reception on its intro- to the House of Lords, either on the for the second reading or on the motion it to a Select Committee; but we is as well that the latter motion was l by the large majority of 109 to 37 s a Bill which has been carefully con- in the House of Commons, both in tee and by the House, could hardly be for a whole session or longer by the House. Amongst the noble lords who rt in the two debates there was almost nsus of opinion as against the creation special tribunal, at any rate in the rovided by the Bill, and the Lord lor, in his reply, expressed a readiness part of the Government to listen to oposals that might be made on this

Ernle raised the point that if sur- were members of the tribunal, the Bill state whether they were to be allowed inue in practice, but if they were to practice they might rapidly lose touch ne conditions prevailing. whilst if they o continue in practice they might be one day and witnesses in the same f case the next day. The Lord Chan- ndicated in his reply that they were inue in active practice. We venture to that there is great weight in Lord objection, for without the least re- on men of the highest probity, it be satisfactory either to parties to dis- or to themselves that they should be ing opinions as witnesses on matters same kind as they may be called upon de judicially.

details of the Bill remain to be dis- in the Upper House, but, of course, the of goodwill was referred to. We that the Lord Chancellor, in his speech second reading, as reported, first spoke dwill being a reasonable subject for sation on the renewal of a lease, but bsequently he referred to compensation odwill being payable on a tenant quit- s holding. As we have pointed out in ticle in our issue of 2nd inst., there is difference between these two proposi- the first may be both reasonable and able, but the second can be neither; e observe that Lord Jessel used the expression that we did in the above defining goodwill as a will-o'-the-wisp. is a certain divergence of opinion on bject, as is shown by Lord Parmoor ting that the situation of the premises be an element in assessing compensa- r goodwill.

notice that in both Houses of Parlia- there has been a tendency to explain f course, this Bill was not intended to "good landlords"; it was only in- l to prevent the nefarious practices of l landlords, but we must protest against ind of argument. The Bill, if it passes, e the law of the land, and it will affect ndlords—good, bad and indifferent—for Bill lays down principles such as those ned in this Bill the landlord has not to be considered but also the tenant, enants are also good and bad, and an ement is offered to tenants to try and l they can. Lord Carson put the matter "In the future no two men, though were on perfect equality, could enter a contract for a lease without in- g themselves in all the provisions e Bill. The Bill would more or put an end to the leasehold n. It would be disastrous to men who d to start a business. No one would ncney on such property. In that way ld discourage building." Lord Carson supports the view we expressed in our articles: legislation of this character, s does Rent Restriction, which fetters landlords in the use of their property, puts an end to private enterprise, for the uncertainty involved in possessing property deters business men from holding it. Lord Sumner expressed the opinion that as soon as this Bill became an Act there would be an agitation started to extend it to private dwellings, and we note that he also suggested, somewhat on the lines we indicated at the end of our article on this Bill in the issue for November 25, that the great structure set up by the Bill could be dispensed with and tenants complaining of harsh treatment should simply be allowed to appeal to the Court for relief.

We suggested a simple declaratory Statute, the provisions of which could be enforced by the Courts.

It is too late now to hope for such stringent amendments as these, but it is well that it should be pointed out that statutes which aim at such detail as do many of those passed in the last 20 years are good neither for those they are intended to assist nor for anyone else, except the lawyers.

NEW BUILDINGS IN LONDON

Tufton-street. — BUILDING. — In our last issue under this heading we stated that Messrs. Browett, Taylor, Robertson & Morgan, of 3 and 4, Lincoln's Inn Fields, W.C. 2, were proposing to erect a building on the site of the western side of Tufton-street and Marsham-street, Westminster. This information, which was based on the Westminster City Council agenda, is, we are sorry to say, incorrect, as Messrs. Browett, Taylor, Robertson & Morgan only submitted an application to the Westminster City Council for consent to the erection of a proposed building on the site.

Acton.—EXTENSIONS.—H.M.O.W. inviting tenders for extensions to the branch P.O. and sorting office at Acton, W. Plans are by the architects' department of H.M.O.W.

Battersea.—ADDITIONS.—Messrs. J. Lyons & Co., Ltd., have applied to the Battersea Borough Council for consent to alterations and additions to Nos. 24 and 26, St. John's-road.

Battersea.—SHOPS.—Mr. J. W. S. Burmester, of 13, Queen Anne's-gate, S.W.1, is the architect for the new shops and flats which are to be erected at the corner of Belle Vue-road and Wiseton-road.

Bayswater.—GARAGES.—Messrs. J. Kinnimont & Sons, of 26, Chilworth-street, W. 2. are to erect lock-up garages on a site out of the northern side of Moscow-road, Bayswater.

Blackheath.—HALL.—Work is commencing upon the site at Blackheath, S.E., where a new parish hall is to be built for All Saints' church. The architect is Mr. C. C. Winmill, L.R.I.B.A., 2, Eliot-place, Blackheath, S.E.

Charlotte-street.—RECONSTRUCTION.—No. 25, Charlotte-street, W.1, is being extensively reconstructed. The builders are Messrs. D. Prosser & Son, 23, Charlotte-street, W.1, and the architect is Mr. L. N. Barrett, A.R.I.B.A., 6, Vere-street, W.1.

Cricklewood.—LABORATORY. — Tenders for the erection at the P.O. Research Station of a laboratory for H.M.O.W. are being invited.

Croydon.—HOUSES.—Mr. R. Pierson, of 47, Wakehurst-road, is to erect 22 houses in Springfield-road, Croydon.

Ealing.—HOUSES.—Sixteen houses are to be built in Coston-lane, Greenford, for Messrs. Dulland.

Endell-street.—ALTERATIONS.—The Holborn Borough Council have given sanction to Mr. J. E. Parr, Borough Surveyor, permission to invite tenders for alterations to the second-class men's private washing baths at the Public Baths in Endell-street, W.C. 2.

Euston-square. — RECONSTRUCTION. — Mr. C. W. Clark, architect to the Metropolitan Railway Co., has prepared plans for the reconstruction of Euston-square Station.

Hendon.—LIBRARY.—Tenders are being invited by the Hendon Urban District Council for the erection of the first portion of a Public Library at The Burroughs, Hendon, N.W.4. Mr. J. M. Wilson, F.R.I.B.A., 4, Staple Inn, W.C., is the architect.

Holland Park-avenue.—ALTERATIONS.—Holland Park Hall has been bought by Sir Herbert Austin on behalf of the Austin Motor Company, Ltd., who will use it from next June for wholesale distribution of cars and as a service depot. Some alterations will be necessary.

Lewisham. — HOUSES. — A further 160 houses are to be erected on the Downham estate, Lewisham, for the London County Council.

London-street.—ADDITION.—The Paddington Borough Council approved application from Messrs. Thompson & Walford, architects, Leadenhall-buildings, E.C. 3, for consent to the erection of a projecting architectural feature to "The Load of Hay" public house, London-street, W. 2.

Morden. — ENLARGEMENT. — The Underground Railway Co. have decided to enlarge the Underground garage at Morden to increase the size of it by the provision of six new bays having accommodation for fifty more cars.

Peckham.—SCHOOL.—The London County Council are to erect at £48,572 a new secondary school for 450 girls at Homestall-road, Peckham Rye.

Poplar.—COTTAGES.—The Poplar Borough Council is to build 108 more cottages in British-street, Millwall, at a cost of £60,000.

Queen's-road.—REBUILDING.—Messrs. P. J. Westwood & Emberton, 7, Adam-street, Adelphi, W.C. 2, are the architects for proposed rebuilding of Nos. 131 and 131a, Queen's-road, next to Porchester-gardens.

Richmond.—A large block of premises, consisting of shops on the ground floor and high-class residential flats above, is to be built on the site of Talbot House, near Richmond Bridge. The architect is Mr. E. J. Partridge, F.R.I.B.A., Bank-chambers, Richmond.

Richmond.—HOUSES.—Messrs. Couch & Coupland are to build 19 houses in Queen's-road, Richmond.

Richmond.—The local Order of Oddfellows have decided to proceed with the building of a new hall and offices in Parkshot. The architect is Mr. E. J. Partridge, F.R.I.B.A., Bank-chambers, George-street, Richmond.

St. Helens-place.—Messrs. H. J. Greenham, Ltd., are pulling down the old property in St. Helens-place, E.C., prior to the erection of a large office block by Messrs. Dove Bros., Ltd., Cloudesley-place, Islington, N.1. Mr. Henry A. Saul, F.R.I.B.A., 10, Gray's Inn-square, W.C.1. is the architect.

Soho.—RECONSTRUCTION.—The premises at the corner of Carnaby-street and Canton-street, W.1, owned by Messrs. E. Austin & Sons, Ltd., are to be reconstructed. The builders are Messrs. E. A. Roome & Co., Ltd., 7, Urswick-road, E.9.

Tottenham Court-road.—FLATS.—"Karridale Mansions" are being erected above Goodge-street Underground Station to the designs of Mr. H. G. Leslie, A.R.I.B.A., 13, South-square, W.C.1. The builders are Messrs. Perry & Perry, 20, Woodstock-street, W.1, and steelwork is being supplied by Messrs. Smith-Walker, Ltd., 33, Tothill-street, S.W.1; cast-stone dressings are being made by the Enfield Stone Co., Brimsdown.

Tottenham-street.—New premises are to be erected for Messrs. E. T. Heron & Co., Ltd., printers, etc., in Tottenham-street, W.1, to the plans of Messrs. Matthews & Son, 72, Tottenham Court-road, W.1. The builder is Mr. F. E. Little, 569a, High-road, Tottenham, N., and the steelwork will be erected by Messrs. E. Webb & Co., 89, Charterhouse-street, E.C.1.

Vauxhall Bridge-road. — GARAGES. — The Central Motor Co. (London), Ltd., are to erect garages on a site in Stanford Mews, Vauxhall Bridge-road, S.W.1.

Westminster.—The Temperance Council of the Christian Churches, of Abbey House, Victoria-street, S.W.1, are proposing to build new headquarters on a site in Westminster.

RATES OF WAGES IN THE BUILDING TRADE

NEW BUILDINGS IN SCOTLAND

Glasgow.—EXTENSIONS.—Funds are being raised by the Glasgow Baptist Association for purposes of church extension and consolidation.

Bathgate.—EXTENSIONS.—The Scottish Co-operative Wholesale Society have decided to proceed with a number of extension schemes. These include the erection of a new creamery at Bathgate for the convenience of several societies in that locality, at an estimated cost of £7,000. It is also proposed to extend the cartwright workshop in Glasgow at an estimated cost of £9,000, and to build an addition to a factory in Dundee at a cost of £3,400.

Burntisland.—EXTENSION. — The British Aluminium Co. have accepted the offer of a firm of contractors for carrying out extensions of the buildings and plant of their Burntisland branch.

Kirkintilloch.—HOUSING.—The Kirkintilloch Town Council have accepted offers for the erection of 36 houses at Back o' Loch.

Peebles.—WATER SUPPLY. — The Peebles Town Council have decided to adopt, on the recommendation of Messrs. J. & A. Leslie & Reid, a scheme for the improvement of the town's water supply, at a sum of £18,650.

Edinburgh.—Suggestions for the clearing of Cramond and Portobello foreshores and the preparation of the sea front at Lauriston Castle have been recommended by the subcommittee of the Lord Provost's Committee of Edinburgh Town Council. Mr. W. A. Macartney, Burgh Engineer, has estimated the total cost of the scheme at £17,000.

Ayr.—ADDITIONS.—The Ayr Town Council has agreed, on the recommendation of the Bathing Committee, to instruct the surveyor to prepare plans for 24 additional bathing-boxes on the battery wall.

Ayr.—DWELLINGS.—The Ayr Town Council has approved of plans for the erection of four two-apartment dwellings by Miss Campbell, Craigie House, Ayr, at 113, Wallace-street.

Dundee.—COLLEGE.—Mr. George Bonar, a jute manufacturer of Dundee, has given £40,000 for establishing a commercial college in Dundee.

The Rialto Cinema.

In connection with the Rialto Cinema, illustrated in our last issue, we are asked to state that the contractors for the work were Messrs. E. Garfield, Ltd., in whose name a misspelling occured owing to a printer's error.

BUILDING TRADE WAGES IN SCOTLAND.*

*These prices apply to *new buildings only.* They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployments Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

NEWS ITEMS

Southport Foreshore Development.

News has been received at Southport that the Ministry of Health has sanctioned the Corporation's application to borrow £65,000 for the purchase and part development of 750 acres of land at Birkdale and Ainsdale which is now chiefly composed of sandhills.

Eton Infirmary Extensions.

The Board of Guardians has instructed Mr. Herbert Stribling, architect, to prepare a rough plan for the enlargement of the infirmary, making provision for 25 beds on the first floor, 25 beds on the second floor, and some nurses' rooms in the roof, and to give an estimate of the cost.

Darlington Builder Honoured.

In recognition of his services to the Darlington and District Master Builders' Association, Mr. W. E. Stairmand, of Darlington, who has been associated with the building industry for about forty years, was presented at the annual dinner of this institution with a silver salver, silver tea and coffee service, snuffbox, and cheque. He was president of the Association from 1914 to 1919, and chairman of the local conciliation board during the whole of its existence. He is an ex-president of the Northern Counties' Federation of Building Trades Employers, and a member of the National Conciliation Board and the National Demarcation Board.

British Standard Specifications for Oil Pastes.

The British Engineering Standards Association has just issued three new British Standard Specifications for Brunswick or chrome-green oil paste for paints, Indian reds (pale, middle and deep), for paints and black oxide of iron for paints. They contain clauses regulating the composition, together with standard reception tests, for the purchase of these materials, together with appendices giving methods of carrying out the tests. Copies of these three new Specifications (Nos. 304, 305 and 306, 1927) can be obtained from the British Engineering Standards Association, Publications Department, 28, Victoria-street, London, S.W.1, price 2s. 2d. each, post free.

A New Garage, Enfield.

Work on the new L.G.O.C. garage at Southbury-road, Enfield, is well advanced, and it is hoped to have it completed and in use in six months' time. This garage is to have accommodation for 108 buses. The new building, which has a floor area of 37,000 sq. ft., is of brick with imitation stone facings. The main doors will be of the sliding-folding type now in use at the most modern L.G.O.C. garages. Two underground petrol tanks to hold 12,000 gallons of petrol and the usual repair shops and offices will be installed. The latter are being built in such a manner that it will be possible to remove them to some other position should extra floor space be needed for a future extension of the garage. Automatic sprinkler devices in case of fire will, as usual, be fitted.

Smoke Abatement Regulation.

By the Public Health (Smoke Abatement) Act, 1926, power is given to the Minister of Health to make Orders extending the provisions of the Alkali, etc., Works Regulation Act, 1906. A draft Order has been prepared extending the list of noxious or offensive gases mentioned in that Act, and extending the list of scheduled works requiring registration under the Act. Copies of the draft Order may be seen at the Offices of the Ministry of Health, Whitehall, London, S.W.1, or they may be purchased from His Majesty's Stationery Office, Kingsway, W.C.2. A Public Inquiry was held into the subject matter of the draft Order by Dr. T. L. Bailey, Chief Inspector, Alkali, etc., Works, at the Offices of the Ministry of Health, Whitehall, London, S.W 1, on Wednesday, December 14, 1927.

XXIII. No. 4430 DECEMBER 30, 1927.

ANTIQUITY UP TO DATE

ECOGNITION of the claims of antiquity is widespread in the present generation. That is to say, a vast number of persons, whose work, habits of thought, and upbringing do not lead them naturally into paths of archæology or art, have acquired a habit of ng an old church, an ancient bridge, a Tudor farmhouse, oman wall as something at which it is right and proper one's eyes with admiration. That such admiration is, e cases, simulated, a mere snobbish pose, is merely tal to the main fact that a great number of persons now and talk about the antique. It is a wholesome product ge of easy transport and organised sightseeing, and it tomatic of the desire for "education" in its pleasurable iable forms.

there is a danger that this awakening, on the part of rto unappreciative section of society, to the claims and f the "old" and the "old-world" and the "quaint" directly, work damage to the very objects of its venera- That "imitation is the sincerest form of flattery" may in nine cases out of ten. But in the tenth case imitation come the severest form of injury. Cheap counterfeit ing discredit. The *Manchester Guardian* drew attention to the cult of "Ye olde," and to the ignorant mischief roduced by its worshippers. There appeared a stern, rous, indictment of the "Back-to-Chester Movement," ament that "One after another our decent Regency and an plaster-faced taverns and restaurants are being d and transformed into mock antiques, with front gables itation magpie work, and called 'Ye olde' something or Examples of "twentieth-century Tudor work" were nd the paragraph ends: "All this costs a great deal of and one wonders why it is spent. Does anyone really e olde' since Harrison Ainsworth died?"

ve old things, to be an antiquarian, and to "like 'Ye are three distinct attitudes of mind. The last of these s found in such as will buy imitation ancient wood- to stick on to a cheap deal sideboard. There is a on" in antiques, just as there is in dress, but modish ty is not always the antiquity of the archæologist, nor rily agreeable to the lover of beauty. Some professed rs of "old" things would cheerfully cast forth a piece obean embroidery, or an Adam mantelpiece to the jumble sale as too *démodé* for their own rooms, if it were ed that Victorian beaded footstools or fringed anti- ars had reached the status of "antiques" and were ing to the position of "fashionable" furnishings. Others nore discernment will be at great pains to have a well- copy of a fifteenth-century door made to accommodate genuine fragment of old ironwork. And so antiquity precarious position in our midst.

transplanting of old buildings is another aspect of the subject. The status of ancient edifices, laboriously ed stone by stone from their original site and re-erected ere, must be inevitably a trifle anomalous, however ate the method of preservation. Concerning an old recently removed "brick by brick and beam by beam" uffolk, and rebuilt within ten miles of London, we read: it stands exactly as it stood before, and even has its l bulges."

lition, the handing down of the spirit of craftsmanship essentials in design, is of such value that without it pro- is inevitably stunted. The careful and accurate repro- n, on a limited scale, of the best examples of old work- ip, in furniture, interior decoration, and more rarely of whole buildings, may be legitimate and right. It may add to the number of those who can have visual enjoyment of something which would otherwise come only within the view of the wealthy or the fortunate few. The classic copies of famous sculptures, frequently found, were often so well executed as to be almost indistinguishable from the original masterpiece. But in days of mechanical reproduction an object of great worth and beauty may become in a "copy" not merely worthless but pernicious. Especially must this be so in the case of buildings whose construction of to-day is overlaid with a counterfeit antique appearance. To cultivate in a large body of people an indiscriminate taste for the mock antique, irrespective of the quality of the workmanship, is a very doubtful benefit to the public, and capable of reacting detrimentally upon present day design and craftsmanship. It is one thing for a designer or craftsman to absorb motifs, forms and methods from the works of his predecessors; it is quite another to pander to the semi-formed taste of a public nourished largely on cheap imitation and second-hand emotions. It is noteworthy that the Council for the Preservation of Rural England, in their advice on restoration of old cottages, advocate the simplest and plainest of modern plaster treatment in the event of rebuilding being necessary, rather than any attempt to give a false air of antiquity to a building which is no longer genuinely ancient. Only by perceiving the antique in the right perspective can we get back to producing detail such as that for which Sir Robert Lorimer pleaded in *The Times* that may be "some piece of real enjoyment, an invention, an artist's work."

How long must elapse between the time at which a custom, a costume, a chair, or a building, is despised as "old fashioned," and the period at which it is acclaimed as "old"? Leaders of modes in building, as well as in styles of dress, look backward, consciously or unconsciously, as well as to their own day. In the late nineteenth century the Gothic Revival marked the reversion to mediæval antiquity, but in the same way the previous period had been that of the Renaissance of Classic forms of a still remoter antiquity. At present we are confusedly conscious of being heirs of all the ages, and antiquity up to date is no clearly defined period or set of periods. It appears that at Somerset House a document is regarded as "old" at one hundred years after its date. To-day, although woolwork and prim posies from early Victorian days are in favour, with half-hearted attempts to bring in the crinoline, the Victorian era is not yet promoted to the status of antiquity in the building art. Although some of the design of that prosperous, complacent era was such that one hopes for escape from imitation of it when that age rolls in due course into the light of honoured antiquity, yet it is undeniable that much of the building then executed was dignified, though perhaps unimaginative. Some of the lesser "family residences" are modest gems, not to be lightly ignored. It is logical to suppose that voices will be raised ere long against their wholesale destruction. In the meantime there may succeed to the slavish following of "fashion" in antiquity a more analytical spirit, and a desire to examine and enjoy on its own merits each style and period. More people may begin to ask boldly "why a cusp should be considered so very, very dead, and a triglyph so very much alive." There is still urgent need, however, for gentle authoritative guidance of the thousands blindly led towards the altar of antiquity, in order that they may be awakened to truer appreciation, that they may be able to account reasonably for their faith, and may put it into action in promoting beautiful design and honest execution in these days that are not yet old-fashioned, but will one day claim reverence as antique.

NOTES

The League of Nations Building.

THIS building is of such importance that it arouses more comment than can be adequately given in a note, for it presents the architects with a task of exceptional complexity, as the nature of the building is a good deal undetermined, embodying ideas which are not yet established in tradition. In the case of a church or a town hall their requirements are well ascertained, but in the case of the League Building the architects have more or less to rely on their own interpretation. Not that this is to be regretted, for such a task may well be the forerunner of a new impulse to architecture, in which the aims and outlook which govern our life to-day may receive more vital expression. If the convictions towards peace have reality, they should help to shape the building in directions corresponding to these higher interpretations of human relationships. How far this should affect the methods of approach and the practice to be followed in order to give reality to such belief it is not the place to enter on here. But many thoughts arise in contemplating what they should be.

The Principles of Architecture.

IN his letter to the *Times*, of Wednesday, Sir John Simpson, Past President of the R.I.B.A., makes some interesting remarks on the principles underlying design in architecture arising out of an article in our contemporary on the designs for the new League of Nations Building. The condition, says Sir John, "of the League of Nations competition that its structure must 'symbolise in style and outline the pacific ideals of the 20th century' is mere rhetoric. Architecture cannot express an abstraction. It 'subserves utility,' as Addington Symonds long ago pointed out, and the symbolism which attaches to certain types of building—ecclesiastical, Parliamentary, municipal, or domestic—arises from secular repetition of accepted forms, expressing what your correspondent has aptly named their 'institutional plan.' Starting from this sound basis, and not from any attempt to invent symbolism, the typical building to house the League of Nations may be evolved." Proceeding, he says there need be no "anxiety to write '20th century' upon the building by affecting any 'style' or absence of style. Every building dates itself. Even the efforts of conscious copyists are vain; and the nice plagiarisms of the 'Revivals,' whether Classic or Gothic, announce their true age as on a placard. Methods of construction alone will mark the League building as a product of our time. But I view the proposal to combine the authors of four designs in the production of a fifth with great misgiving. No great work of art that I can recall has been produced by such a committee. It seems inevitable that the strongest personality must prevail, or that the result will be a least common multiple from which the convictions of four ideals have been eliminated. Had M. Nenot been invited to collaborate with a painter, a sculptor, and a cultured layman, there had been at least the precedent of the east front of the Louvre, produced by the skilled technician Le Vau, in combination with Perrault, the doctor, and the artist Le Brun. The true purpose of a competition should be to select an architect, not to find a ready-made project. Having chosen the solution of the 'programme' which accords most nearly with their ideal, the promoters should call the author to their councils, and with him revise, elaborate, and inspire the ultimate design to such perfection as may be reached in human affairs."

The Landlord and Tenant Bill.

THE Landlord and Tenant Bill passed the third reading in the House of Lords on December 19. Lord Parmoor made some comments on the drafting of Bills in general and suggested that a Government Committee should be appointed to consider whether the drafting of Bills could not be improved. This suggestion, we hope, will receive consideration, for the drafting of modern statutes is highly unsatisfactory,

gratulated for providing us in agreeable form with the main features of the different styles in so intelligent a way.

14th Century Tracery. A fine example of fourteenth-century window-tracery has been revealed recently in the course of general restoration work at Buttsbury church, Essex. The window had been bricked up, both inside and out. The inner skin of brickwork has now been removed, and the outer is left until the necessary restoration and glazing can be carried out to the three lights and the very beautiful quatrefoil tracery. The window is at the east end of the north aisle, and the existence of a corresponding window in the south aisle is evidenced by indications of a similar arch. Buttsbury church, which has been described as "a very humble, though ancient, structure," has an appearance of spaciousness owing to the chancel being of equal width with the nave and almost the same length. It appears that the east window was formerly blocked as well as the two aisle windows, and the plain rectangular lights in the aisle walls were presumably substituted for them. The church stands inconspicuously on a slight rise away from the high road, and a line of beeches leads to the modest porch. The walls are of the thirteenth century. The low brick tower is of no particular merit, though well-proportioned. Its weather-boarded upper part is surmounted by a ball-topped finial. This tower replaces an earlier square tower of flint and stone, crowned by a shingled spire. There is some good ironwork on the north door, contemporary with the tracery.

GENERAL NEWS

Professional Announcement.

We learn that Mr. John Mitchell, general secretary of the Association of Architects, Surveyors and Technical Assistants, will be resigning his appointment at the end of this year, to take up the position of the deputy Art Editor of the "Encyclopædia Britannica."

Mr. J. H. Kerner-Greenwood's Estate.

Mr. John Henry Kerner-Greenwood, of Vyse Court, Bishops Stortford, Herts, and formerly of King's Lynn, proprietor of "Pudlo," the waterproofer for cement, and of Messrs. Kerner-Greenwood & Co., Ltd., left £133,606 (net personalty, £44,681).

Mr. Robert Evans's Estate.

Mr. Robert Evans, of Ravine House, Lenton-road, The Park, Nottingham, senior partner in the firm of Evans, Clark & Woollatt, left £13,719.

Mr. S. Robinson's Estate.

Mr. Samuel Robinson, of Ben Rhydding, Ilkley, Yorks, founder of Messrs. Samuel Robinson & Sons, architects and surveyors, Bradford, left £27,406.

A Proposed New Town Hall, Blackpool.

A sub-committee of the Blackpool Town Council has been appointed to consider the provision of a new town hall to meet the present and future needs of the Corporation.

New Freemasons' Hall in Nottingham.

The announcement was made at the annual meeting of the Provincial Grand Lodge of Nottinghamshire Freemasons, held at the Albert Hall Institute, Nottingham, that the erection of the new £60,000 hall in Goldsmith-street is to be proceeded with. Tenders are shortly to be invited for the demolition of the property in Belgrave-square which has been acquired to provide the additional land for the site.

A New Grammar School, Thorne.

At the meeting of Thorne Rural Council, plans of Thorne's new grammar school were approved. The school will provide accommodation for 135 boys and 135 girls, with future extension for 90 boys and 90 girls, making a total of 450 pupils. Plans have been prepared by Mr. H. Wormald, A.R.I.B.A., Education Architect, County Hall, Wakefield.

Essex School Extensions.

The School Building Committee of the Essex Education Committee has approved a tender of £49,979 for the erection of a County High School for Boys at Leyton. The architect to the committee, Mr. John Stuart, F.R.I.B.A., has prepared the plans. The proposal of the Walthamstow E.A. to provide a new public elementary school for about 400 children at Billet-road was also approved.

Polytechnic Dinner and Re-union.

The fourth annual dinner and re-union of the past and present students of the Surveyors' and Auctioneers' Section of the Polytechnic, Regent-street, will be held on Wednesday, January 4, 1928, at the Quadrant Restaurant, 74, Regent-street, W. Mr. W. R. Davidge, F.R.I.B.A., F.S.I., will occupy the chair. Particulars and tickets can be obtained from Mr. F. C. Renny, 22, West-hill, Highgate, N.6.

Gates of Grosvenor House.

The Phyllis Court Club at Henley has purchased the two pairs of gates and the seven lamps of Grosvenor House, and thus saved them from leaving the country, which at one time seemed probable. The gates were acquired by subscription among the members of the club, and with a stone screen will form the Club War Memorial. The gates were designed a century ago by Cundy, and each gate weighs three tons, making twelve tons for the gates alone.

Oxford Preservation Trust.

In a written reply to Lady Astor, M.P., who asked whether the Minister of Health had received any official communication from the Oxford Preservation Trust, and how far the trustees were co-operating with the Oxford City Council in their town-planning scheme or with the proposed regional plan, Mr. Chamberlain states, according to the *Times*, that he has not received any official communication from the Trust, but he understands that co-operation is contemplated between the Trust and the City Council.

New Bank Building, Manchester.

We understand that plans for the erection of a new bank for the Co-operative Wholesale Society have been submitted to the Manchester City Council. The building, which will be of six stories, will be 90 ft. high, and will have a frontage of 160 ft., and will form a continuous frontage to the existing C.W.S. buildings in Corporation-street and Balloon-street.

Boston "Stump."

Much anxiety has been caused in Boston by the state of the historic church of St. Botolph, commonly known as The Stump, owing to the ravages of the death watch beetle in the timbers of the main roof, portions of which are in danger of collapse. These timbers, it is stated, will have to be entirely renewed, and the aisle roofs are also defective. The walls of the tower are badly cracked, and it will be necessary to secure these and strengthen them. The estimated cost of the repairs is £30,000, and the Mayor and Corporation are giving a lead to the work by broadcasting an appeal for assistance.

The Devastation of the Countryside.

Major-General Sir Fabian Ware, at an exhibition of the Gloucestershire Architectural Association at Cheltenham recently, appealed to architects to prevent the devastation of the countryside. Whenever he visited that part of Belgium which had been devastated by war, but was now restored, he said, and compared its present state with that of the most beautiful of England's uplands, he asked himself whether the burden laid on England by the war was greater than she could bear. But from all parts of England came stories similar to that which they had to tell in the Cotswolds; the beech woods were being felled and not replanted, the stone tiles were being torn off their ancient barns and houses and sold to the United States to roof American buildings. They were replaced by corrugated iron, painted red, or, at best, by asbestos tiling.

The Ken Wood Art Gallery.

The General Purposes Committee of the London County Council reported at a recent meeting of the Council the receipt of a letter from Lord Iveagh in which he set forth the Council's position with regard to the gift by his father of Ken Wood House, park, and pictures for public purposes.

"The trustees," Lord Iveagh wrote, "are directed to complete the preparation of the mansion for this purpose at the expense of the late Lord Iveagh's estate, and therefore the maintenance of the gallery is provided for by an endowment fund of £50,000 given to the will trustees. It is the desire of the present trustees that in due course the constitution of the gallery under the management of an appropriately constituted governing body shall be worked out in mutual accord with your Council, without any more delay than is inevitable."

The Council placed on record its deep appreciation of the munificent public spirit shown by the late Earl of Iveagh.

Somerset Conference on Rural Beauty.

Convened by the Somerset Rural Community Council, a representative county conference was held at Taunton on December 17, to discuss the preservation of the countryside from scattered and disfiguring building development in connection with the expansion of urban areas, also the preservation of rural scenery and the protection of the artistic and historical features of Somerset towns and villages. Lord Bath presided. Mr. Guy Dawber, A.R.A., said the Council for the Preservation of Rural England was founded a year ago to give help to those who to preserve the countryside and to dire proper channels the revolutionary c that the new methods of transport bringing in their train. Building d ment, of course, there must be, but was no need for the desecration countryside which was going on so throughout practically the whole of E The Council could claim to have arou consciousness of a vast number of the to the peril which was making the as hideous as some of the towns, thoughtlessness and indifference. W gard to new arterial and other ro public authorities at once decided to the cost of construction to the f owners the present system of "ribb velopment" of land alongside the hi would speedily be checked. The con passed a resolution heartily approvi principles of the Council for the Prese of Rural England, and pledging its s

SOCIETIES AND INSTITUTIONS

ESSEX SOCIETY OF ARCHITECTS: ANNUAL DINNER.

The Essex Society of Architects, which originated in Southend a year ago, recently held its first annual dinner at the Queen's Hotel, Westcliff. The President (Sir Charles Nicholson) was in the chair, supported by Mr. Walter Tapper (President, R.I.B.A.), the Secretary, R.I.B.A. (Mr. McAlister), the Mayor and Mayoress (Coun. and Mrs. A. Bockett), the Deputy Mayor (Coun. W. J. Hockley), the Mayor of Chelmsford, the Deputy Mayor of Colchester, the Archdeacon of Southend (Ven. P. M. Bayne), Ald. H. A. Dowsett, Coun. O. H. Cockrill, Dr. Harmon Morgan, Dr. Charlotte Shields, Mr. Percy Brockbank, Mr. Martin-Kaye, Mr. H. R. Cowley, Mr. A. J. Arnold, the Borough Surveyor (Mr. R. H. Dyer), Mr. A. S. Belcham, Mr. George F. Grover, Mr. Percy G. Hayward, Mr. Norman Evans, Mr. Wykeham Chancellor, Mr. Duncan Clarke, Mr. J. J. Crowe, Mr. D. H. Burles, Mr. W. G. Beecroft, Mr. J. G. Drysdale, Mr. C. H. Boskett, Mr. A. J. Connabeer, and others.

Proposing the toast of "The Royal Institute of British Architects and Kindred Societies," the President expressed his gratification that they had the President of that society with them.

Mr. Walter Tapper, responding, said he believed it was practically the birthday of the Southend Society of Architects. The President and some of his colleagues came together a little over a year ago and formed the Society, and with tremendous enthusiasm and energy they had done wonders. They numbered in their ranks some sixty members in the architectural sense, but nothing in the records of the Society interested him more—as President of the Royal Institute—than to find what they had done in the way of education. He could really congratulate them upon so rapidly developing a school of architecture—a school which was recognised by the Royal Institute. Really they had done extraordinarily well in a short time. Of course, they were very fortunate in being able to get as their President his old friend, Sir Charles Nicholson. Southend, continued the speaker, had grown with American rapidity, so much so that there had not been time hardly for the townspeople to think about the type of buildings which had to be erected. He was informed they needed a town hall worthy of themselves, and he was also informed that the School of Art was housed in a temporary building. Well, that ought not to be. That school should be housed in a place of architectural refinement, so that it might be an inspiration to all the students.

If they were going to make Southend a place of dignity for people to come to, as they came to other parts of the country from all over the world, they would only get it if the laymen really desired architecture. The architect must also be a man of culture and, in addition to that have a profound knowledge of his work. In his view, the spoliation of the countryside was a grave thing. They found the whole of the countryside was being ruined, and it was time they bestirred themselves. There was a Society for the Preservation of Rural England, and he thought it was for their Society to get into touch with them and to endeavour in every possible way to prevent the ugly shacks and disreputable places being put up and ruining the countryside. In Manchester they were enrolling the school children for the purpose of keeping the country roads tidy—to clear up the roads after the motorists. He commended that movement because the resulting orderliness very much affected architecture. He claimed that their Society had a refining influence on the whole of the community.

Proposing the "Essex Societies and Architects," the Mayor said there was a great scope for architects to educate people in what was beautiful and what was necessary as far as housing accommodation was concerned. In his opinion, it was not the public but the influence of architects which would produce beautiful houses—it was the influence of the architect which would make Southend and other towns beautiful. The Corporation were wholly dissatisfied with the accommodation they possessed, and were determined that at the earliest opportunity Southend should have municipal offices worthy of a great city. At the present moment they were taking the opinion of a great architect on the matter, and had obtained a report from him. He hoped that then there would be erected a town hall, law courts and municipal offices which would be a credit to Southend.

Mr. Wykeham Chancellor responded.

Proposing "The Mayor and Corporation of Southend," Mr. J. G. Drysdale pointed out that the town planning scheme left Southend itself untouched. High-street, for instance, had been built and rebuilt at a cost of thousands of pounds and still it was not possible to call it a thoroughfare with any continuity of character.

Replying, Ald. Dowsett said that, with regard to the erection of houses, he would like to see a law passed prohibiting anyone building a house unless it was designed by an architect, and no one should be allowed to practise as an architect unless he had passed the necessary examinations.

Mr. Duncan Clarke proposed "The Visitors," and Mr. J. Crowe "The President."

SOUTHEND CHAPTER, ESSEX SOCIETY OF ARCHITECTS.

At the annual business meeting of the Southend Chapter of the Essex Society of Architects, the following were elected officers for 1928: Chairman, Mr. D. H. Burles; vice-chairman Mr. Percy Hayward, F.R.I.B.A.; hon. secretary, Mr. D. N. Martin-Kaye, A.R.I.B.A.; hon. treasurer, Mr. Herbert R. Cowley, F.R.I.B.A.; past president and hon. librarian, Sir Charles Nicholson, Bt.; members of Executive Committee, Messrs. H. W. Allardyce, F.R.I.B.A., Mr. Norman Evans, L.R.I.B.A., Mr. G. F. Grover, Mr. Percy Brockbank and Coun. O. H. Cockrill, A.R.I.B.A.; hon. solicitor, Mr. J. G. Drysdale, M.A.; hon. auditor, Mr. H. Wicks, A.I.S.A. The annual report and statement of finance for the past year were submitted and approved, and a vote of thanks was accorded with acclamation to Sir Charles Nicholson for his services to the Society. A meeting of the executives from Colchester, Romford, Chelmsford and Southend was held at the Queen's Hotel prior to the dinner for the purpose of drafting the necessary constitution for the Essex Society of Architects and to elect officers for 1928. The following were nominated to serve: President, Sir Charles A. Nicholson, Bt., M.A., F.R.I.B.A.; vice-presidents, Mr. Duncan W. Clarke, A.R.I.B.A., Chairman Colchester Chapter; Mr. F. Wykeham Chancellor, M.A., F.R.I.B.A., Chairman, Chelmsford Chapter; Mr. D. H. Burles, Chairman, Southend and District Chapter; Mr. J. J. Crowe O.B.E., A.R.I.B.A., Chairman, Western Essex Chapter; hon. secretary, Mr. D. N. Martin-Kaye, A.R.I.B.A., A.A.Dipl.; hon. treasurer, Mr. H. R. Cowley, F.R.I.B.A., F.S.I.; hon. auditor, Mr. Edward Fincham, A.R.I.B.A., P.A.S.I.; members of the Council, Messrs. Edward Fincham, A.R.I.B.A., G. H. B. Gould, A.R.I.B.A., W. F. Andrews, A.R.I.B.A., and H. A. Beckett, Colchester representatives; Messrs. E. A. Wiseman, A.R.I.B.A., E. J. Symcox, A.R.I.B.A., and H. R. Bird, L.R.I.B.A., Chelmsford representatives, together with one further representative for Chelmsford. The Western Essex Chapter have still to nominate four representatives on the council. The Southend Chapter of the Society have nominated Messrs. Hayward, F.R.I.B.A., and Mr. Percy bank, and have still three further me to add. The meeting approved the dra laws and formed committees on finan boundary questions. It is estimate the membership roll of the Societ shortly be approximately 200 memb the profession.

OBITUARY

Mr. W. Hilton Nash, F.R.I.B.A

We take the following extracts fr current *R.I.B.A. Journal*:—It is with regret that we have to announce the and quite unexpected death of Mr. Nash, on December 17. Mr. Nash much younger than his age (he was 7 he had retired from architectural pract many years. His main interests in h years were the affairs of the Arc Benevolent Society, of which he hac honorary treasurer for over 30 years, colour drawing, etching, and tra abroad. He also retained his seat as a ber of the Board of Examiners und London Building Act. Mr. Nash wa in 1850. He was articled to Henry C F.R.I.B.A. (the architect of St. Th Hospital), and was afterwards in the of Mr. E. B. L'Anson; he joined his fat partnership, the late Mr. Edwin F.R.I.B.A., in 1877. For 20 years h also architect to the Merchant Taylors pany, of which he was a Liveryman. gained the Soane Medallion in 1875 elected an Associate in 1881, and a in 1894.

In conjunction with his father, Mr. built or restored several churches, and his father's death he built St. Peter's, ley; business premises for Raphael Tuc Sons; Lloyd's Registry of Shipping, Tea Company's offices, and a large blc offices in Lloyd's-avenue, E.C., the Ch Schools and Head Master's House for chant Taylors Schools: the principal en to Merchant Taylors Hall, and designe oak panelling for the large hall of the company.

Mr. Arthur Grosvenor Wilkinson, F.R.I

Mr. Wilkinson was born at Stoc Cheshire, in 1870. He served his a with Mr. H. Willoughby, F.R.I.B.A. had experience in the offices of leading chester architects. He was later engag the staff (architecture) of the Manc Ship Canal Co. during the construct the canal and the necessary buildings. he commenced practice on his own acco Stockport, carrying out important wor Messrs. The Strines Printing Co., D shire, Sir James de Hoghton, Bt., and clients. He was a member of the Sto Borough Council. During the war he the Royal Engineers as a commis officer, and was afterwards employed c Imperial War Graves Commission.

Mr. A. J. Forsdike.

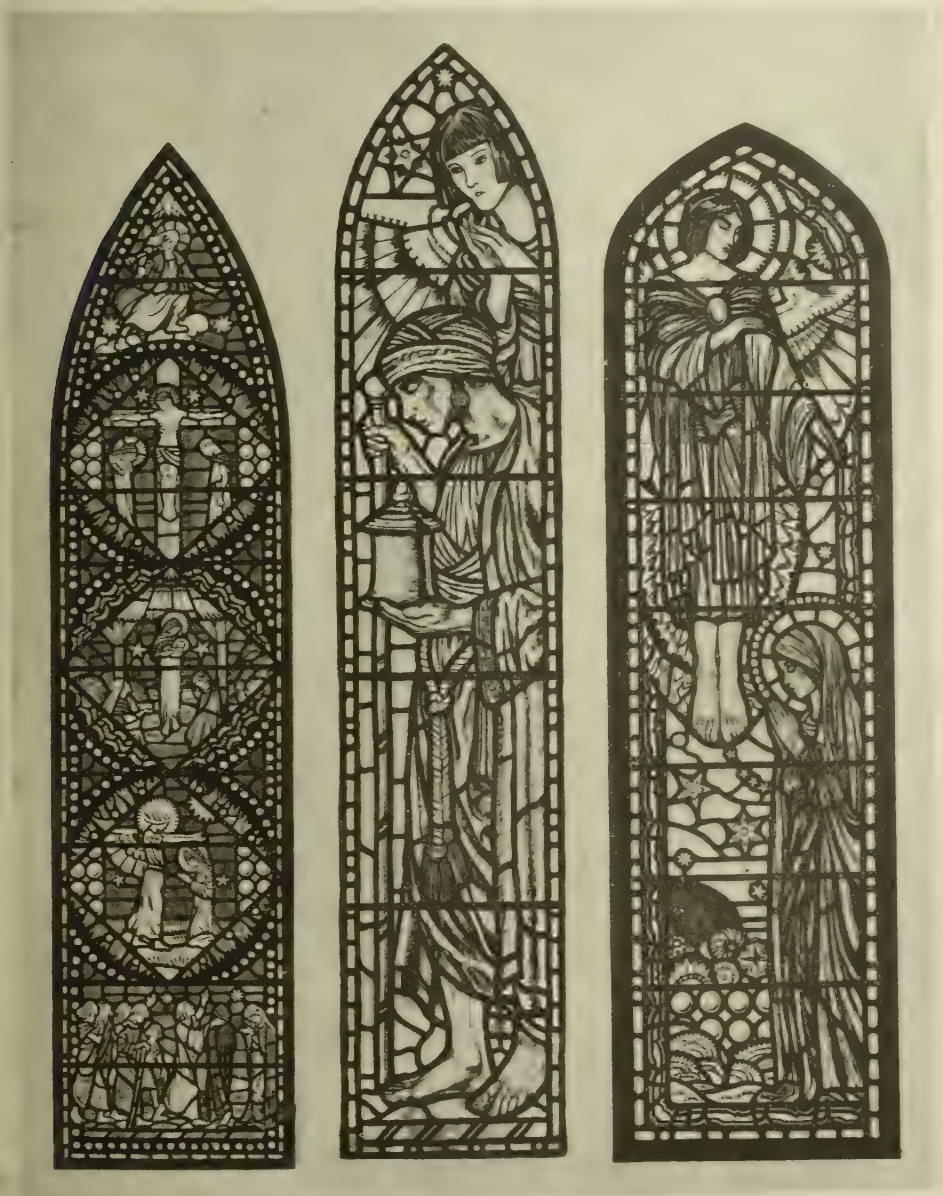
We regret to announce the death Christmas Day, at Sheffield, of Mr. J. Forsdike. Mr. Forsdike, who had b for some months, was a prominent m Sheffield, and had wide interests, both mercial and municipal. He was a mem the Sheffield City Council, and also bu a very successful business as a building tractor, being also interested in the ma ture of bricks. He was best known, pe for his work on the council of the Na Federation of Building Trades' Empl into whose work he threw himself v heartedly. He took also a great intere the social side of the Federation, whe kindly and genial disposition was of value. He was elected president in He was also the immediate past-preside the Institute of Builders.

CIENT AND MODERN STAINED GLASS

give this week some examples of glass design by Mr. Roland Morris, ites as follows:—

hree-quarters of a century stained s suffered probably more abuse than er craft. The so-called Gothic Re- hich began nearly a hundred years s been responsible for an increasing of stained-glass windows being n every church almost as a matter non routine. This attitude towards ft has naturally had the effect of its interest as an art: hence the decadence into which it had fallen he coming of the modern revival. is revival Christopher Whall, who 1924, was the first to stir up new nd treat the craft side of the work parable from that of the art. One to visit Gloucester Cathedral, where is at his best, and remember that ad been no work of this calibre in since the days when stained glass living craft, to realise that some work can be fully as beautiful ancient.

bject of art which has stood the time has generally been created in pendent and individual spirit, not ily with no relation to the works of its kind which have gone before it, but with a view to expressing some new idea about the subject. And thus it is that the stained glass of the twelfth and thirteenth centuries expresses by its simple though adequate treatment the ideas of the workers who first evolved and used this means of church enrichment.



The glass of this period, in many respects the best in the history of stained glass, being characterised by the wonderful richness of its simple colours, is aided by the lavish use of leading, which imparts to it a beautiful jewel-like quality. When this is compared with the fifteenth and sixteenth century glass it is obvious that vast changes had taken place in the attitude of the workers towards their craft. For instance, in the thirteenth century the paint was laid on in firm strokes of the brush, which by the fifteenth century had developed into a careful shading and stippling, with delicate line work, and the leading had become less profuse, while the discovery of yellow or "silver" stain had brought into favour a liberal use of thinly painted white glass.

Thus, while the workers were trying to express something new in their craft, progress was easy and natural, and the work of their time must always therefore have a value of its own. At the present day interest in stained glass is again on the ascent, because new ideas are being expressed in it. It is true that this new work is at present comparatively rare, but it is ever on the increase, and when found is worth studying.

One artist may have totally different preferences in his treatment and design from another, and each do excellent work of his kind. In every case he is necessarily influenced by his own time and environment, and at the present day the tendency is often towards a sweet simplicity and the avoidance of such abundant semi-realistic floral ornament which marred the work of the pre-Raphaelite period. For stained glass is a rigid medium and one which will not lend itself to naturalistic methods, and as authority for this we have the examples of the thirteenth century.

That such a beautiful medium as glass should have fallen into disrepute by reason of the stereotyped procedure which has governed it for the last century is deplored by all art-lovers. Just as in music a single note on the strings or wood-wind is beautiful by itself, so a choice piece of ruby glass is beautiful of its own accord: and in either case we are only isolating the means by which, if not abused, a fine composition is produced.

A sparkling piece of "slab" glass painted with a firm, solid stroke is a real pleasure

Designs for Stained Glass.
By Mr. Roland Morris.

Design for Stained Glass.

to the eye. This has been discovered by some of our modern artists, who are turning their attention to the craft, and it is to them we may look to restore stained glass to that dignity to which our fathers in mediæval days raised it.

STRENGTH AND DEFENCE IN ARCHITECTURE

SIR BANISTER FLETCHER, F.S.A., F.R.I.B.A., in his lecture on Wednesday, December 14—the last before Christmas—dealing with the mediæval secular architecture of France, said castles, country houses, hôtels-de-ville, palaces and hospitals, involved the study of a different aspect of social and political life from that which the cathedrals and churches called forth. Whereas cathedrals such as Amiens, Chartres, and Rheims were largely built by the people for their own use as citizens, castles were the well-nigh impregnable fortresses of a proud and exclusive nobility; while fortified towns testified to the military necessities of those days which demanded stone-built fortifications. The public buildings reflected the delight shown by the citizens erecting beautiful structures in which their disputes should be adjudged, their municipal affairs settled, and their aged and infirm housed, and much exuberant ornament was lavished on these characteristic structures, which stood as monuments of a high order of craftsmanship and art.

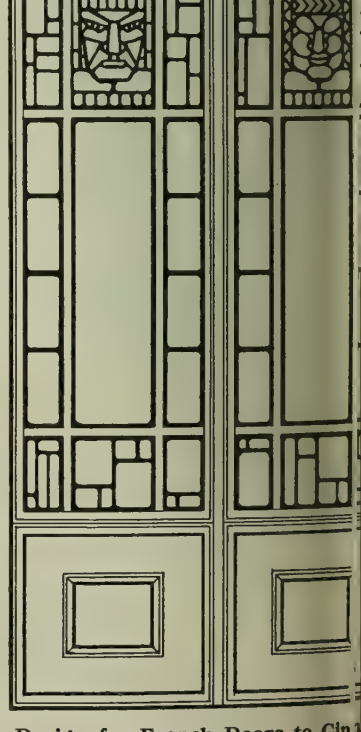
The lectures will be continued next term on January 11, and Sir Banister Fletcher will deal with English mediæval architecture, including cathedrals, churches and domestic buildings, during the term.

A YOUNG ARCHITECT'S IDEAS

By J. E. REID.

WHEN John began his architectural career in the office of a tip-top architect, he brought with him a generous capital of lofty ideas and a mind as spotless and as pure as a piece of alabaster marble. Art for art's sake and architecture for architecture's sake were his constant slogans whispered low and impressively. All the noble thoughts of an enthusiastic disciple of architecture he possessed, the most exalted of them being that art could neither be bought nor sold, and must at all costs be dissociated from contact with money. He was probably thinking of the architectural millennium, when all builders will be virtuous builders, and all architects registered architects.

John felt that he was about to pay homage to a wealth of something he could not exactly define. It might have been the imposing shadow of a great tradition—for he was a patriotic worshipper of those majestic past-masters of architecture who had left their impress on Egypt, Greece, and Rome; also in England, where our priceless Gothic ruins had grown out of an intense religious fervour and to which every earnest student of architecture is a lawful legatee; or it might have been a cluster of other shadows that overcast the pathway of the ambitious student, and make obscure and perplexing his way, which the schools of architecture are alone able to illumine.



Anyhow, the world appeared to John as an academy of wonder, in which building was the most marvellous of all things and architects the immaculate custodians of architecture. His lofty principles were the fertile soil in which all good thoughts are sown, also where they usually remain, except a few that sparkle into glorious flowers, which retain their perfume and then fade after the pupil completes his articles and enters into the serious business of an architect. However, when he had taken an office and had decorated its walls with drawings executed in his pupilage days, he had ultimately to bow before the necessities of life, and become hardened to its behaviour.

This hardening process in the career of an architect occurs when cherished ideals are found to be unreal; that is, when the claims of life become insistent. Anything that does not relate to life, for instance, is unreal. So, like a number of others who face facts, he had to scrap a number of theories he sincerely believed were true, and had to swallow a number of others that were really facts. One of these was that money had to be made first before it could be spent. The share that money played in an architect's business now became a grim reality. The horrible competition in the architectural and building worlds led to a growing suspicion that an architect's mainspring was money. It then began to dawn upon him that his late master's attention was 80 per cent. on money and 20 per cent. on architecture, and that some architects were 100 per cent. on one and nothing on the other. He began to wonder whether his father's £200 cheque, paid at the time he had been finally accepted as a pupil and his articles had been signed, had given his master immense delight.

With all the above thoughts, John waited for business to pour in. Promises of work from the many friends of his father had been made, but they had either forgotten him, out of habit, or had handed their work to other architects. However, John entered for a competition or two, and worked really hard, and produced well-finished drawings which were the admiration of his loving mother and doting sisters, but he never became a place winner. He was now becoming anxious because his banking account was declining. His pencil was not giving him the pleasure that it used. In fact, it would not record his thoughts properly. He was actually hungering for money in an unhealthy kind of way and felt that if it failed to come soon he would have to give up business, when the visit of a wealthy clien duced an agreeable thrill. It was a stream of light had entered the offic gave him more pleasure than putting to paper, and upset his views about more than anything else. When he sc the theories he held he never had rea look back thereafter. It was all ver being an idealist, he said apologetical it is unwise to place theories upon pe without proper bases.

As John grew in wisdom culled fr architectural experience, a number of grew up within his mind. One was th unless qualified by money, was unimp Art that is paid for must be worth for. If art was not paid for it was nothing. The very fact of only pern payable art an existence, mediocre stuf ing the country was precluded. The standard was a kind of beneficial sie the meshes were made of bars of gol higher the price of art, the more appreciated by the public. He declare self in favour of the Architects' Regis Bill, because its objects are to remove tecture from the hands of duffers an it to qualified men, who will natura crease its value by charging clients m doing it. The price of architectu therefore naturally go up, and all ar will be glad.

So John made progress in his b when he regarded it as a business. all, he said, when money was used to alise an architect's conceptions and something useful in bricks and mor was used lawfully. He still retain high principles, but when he gave cent. attention to money and 20 per c art he became a great architect, beca got the jobs. The custom to-day is t ciate architectural greatness with a n cent practice. Even though an archit the letters of the alphabet tacked on name, he remains unrecognised unl gets the jobs. The modern busy a could very truly be pictured holding a cate book in one hand and a fountain the other.

A Rome Scholarship Design.

winning design for the Rome Scholar- vas illustrated in our issue for Novem-

We now give, on our inset plates, a ended design by Mr. J. B. Wride, of f Technical Institute.

Dunstan's Church, Woking, Surrey.

church occupies the site of a former n in White Rose-lane, near the railway n. The nave and chapels, at present ated, were begun in November, 1924, nished, after interruptions, two years The chancel was undertaken afterwards as just been completed. The design, is treated in a free rendering of fifteenth- y Gothic, provides for a large aisle- ave, covered with a heavy open timber n Oregon pine, chancel, side chapels, try, west-end gallery, and sacristies. building is faced externally with d random Bargate stone, with Bath dressings, and roofed with hand-made, aced tiles of a rich colour. Internally nish is with a sand-faced plaster, the yellow colour of which forms an effective st to the Bath stone dressings. A feature de of the stone pulpit, which projects one of the responds of the chancel arch s reached by a stairway built into the ess of the chancel wall. Seating is pro- for about 300 persons.

general contractors were Messrs. rd & Sons, of Dorking and Farnham, were also responsible for the joinery and block floors. The low-pressure heating y Messrs. Metcalf, of Preston; electric ng by Messrs. Murrell & Johnson, of n; bell by Messrs. Gillett & Johnson, oydon; statue and niche by Messrs. n, of Cheltenham.

joint architects are Messrs. J. Goldie . R. Gilbertson Topham, A.R.I.B.A.

House at Totteridge, Herts.

s house is an interesting example of a m-sized residence, with accommodation ded in a novel manner, the ground floor ling not only dining-room, lounge, kit- etc., but principal bedroom, bathroom, dressing-room. There are five bedrooms e first floor. The elevations are com- in a simple and dignified manner, the e wing being effectively balanced by the e.

Stanley R. Miller, A.R.I.B.A., is the ect.

"Redcross," Cambridge.

s house is situated off Hills-road, about miles from Cambridge. As it existed it bad example of Victorian architecture some 60 or 70 years ago, with external of pressed Cambridgeshire stock bricks slate roof, and contained four rooms on round floor and four rooms on the first The house has been entirely remodelled and very considerably extended, and the work presented many difficulties, owing to the poor character of the building. The elevations have been redesigned, as have also the principal rooms.

The general contractors were Messrs. Hard & Dickerson, of Cambridge, and the sub-contractors were as follows :—James Walker, Oxford-street, W.1, special joinery and wood carving; McDowall, Steven & Co., central heating and sanitary fittings; Speedy & Eynon, electric lighting: the Albany Forge, Ltd., Mortlake, metal windows and wrot-metal fanlights, etc.

Messrs. Kieffer & Fleming are the architects

A Branch Bank, North Harrow.

The National Provincial Bank at North Harrow occupies the site at the angle of the Pinner and Station Roads. Full advantage has been taken of this to provide an effective corner entrance by means of a simply designed porch. The building itself is of red brick with Portland stone facings and roofed with dark-red tiles. The contractors were Messrs. Turnbull & Son, and the sub-contractors were as follows :—Bath and Portland Stone Company, stone dressings; Bristow Brothers, of High Wickham, bricks; Dean & Beal and G. & A. Brown, Ltd., sunk courts and internal fibrous plaster.

Messrs. F. C. R. Palmer and W. F. C. Holden, F.R.I.B.A., are Architect and Assistant Architect respectively to the Bank.

White Rock Pavilion, Hastings.

The view of the White Rock Pavilion, Hastings, which we illustrate this week is from a little booklet, further details of which will be found on p. 1035. The White Rock Pavilion —the competition for which was won by Mr. Charles Cowles-Voysey, A.R.I.B.A., and the late Mr. Hugh Morgan—was illustrated in competition form in our issue of February 3, 1922.

The Rialto Cinema, Birmingham.

We illustrate this week an exterior view of this cinema, which has been lately completed from the designs of Mr. Hurley Robinson, F.R.I.B.A. Other illustrations and a description were given in our issue for December 16.

R.I.B.A. Testimonies of Study.

We illustrate this week some Testimonies of Study, by Mr. H. L. Meed, approved in connection with the recent R.I.B.A. Intermediate Examination. We give also an approved design for "A Vicarage," submitted by Mr. J. S. Marsh. The Board of Architectural Education wish it to be known that these Testimonies of Study are published for the guidance of students, not as perfect solutions of the subjects, but to show the general standard of Testimonies of Study approved by the R.I.B.A.

Civic Centre Scheme, Auckland, N.Z.

This scheme is one which was recently suggested by a Civic Improvements Commission at Auckland, New Zealand. The Art Gallery is shown on the reader's right, the present Town Hall filling the right centre. On the left is a building intended to house all the municipal offices in the future. This latter site is at present covered with shops and warehouses.

Students' Work, University of Sheffield.

Some examples of the work of past students of the Department of Architecture, University of Sheffield, are given in this issue. The drawings include design work and a measured drawing of Aston Hall, near Sheffield, a building ascribed to James Carr.

Concrete House Designs.

We give on page 1,002 the names of the winners of this competition. Dealing with the Class A winning design 302, sent in by Mr. Thomas S. Tait, F.R.I.B.A., the assessors state in their report :—

We are of opinion that Design No. 302 be placed first in Class "A." It gives the best solution of the problem which has been submitted, but we invite consideration to the following criticisms of the plan and elevations. On the ground floor plan the section through the closet on that floor shows that the headroom is inadequate and should be reconsidered. A window is also required in the larder. There is none shown.

It is not clear how the wastes of the basins in Bedrooms Nos. 3 and 4 are to be carried to the drains, and the designer appears to be in difficulty as to providing a basin or waste at all in No. 2 Bedroom, apparently for the same reason. The front elevation depends greatly for its effect on a large balcony, 24 ft. 6 in. long, projecting 3 ft. 6 in. by 3 ft. 6 in. high, constructed entirely in concrete. There does not appear to be very great use for this feature in the economy of the plan, which could not have been met by the introduction of a landing with an open railing. The garden elevation will require to be rearranged to meet the foregoing criticisms. The design and use of the materials generally express the intention of the competition in a distinctly characteristic manner, conveying a full appreciation of the use of concrete.

Dealing with Messrs. Frank L. Brown and J. H. Peek's Design No. 210, awarded first prize in Class "B," the assessors say :—

We are of opinion that this design is the best submitted for the small house, but we invite consideration of the following suggestions. There is a good deal of confusion as to how the drainage is intended to be disposed of, and the system requires re-designing. Moreover, it is not clear how the rain water is to be collected from the roof and conveyed to the drains.

First Floor: It is considered that the bath is badly placed and the position of this fitting should be reconsidered.

Water Storage: No tank is shown or any provision for placing one indicated.

The elevation is restrained and makes legitimate use of the material employed. The omission from the elevation of all pipes is regretted, as they must form, in so simple and symmetrical design, a feature which should be considered.

MEETINGS

MONDAY, *January* 2.

Architectural Association. Mr. G. G. Wornum on "Modern Decoration." 7 p.m.

TUESDAY, *January* 3.

College of Estate Management. Mr. T. Alwyn Lloyd on "Modern Cottage Planning and Design." 5.30 p.m.

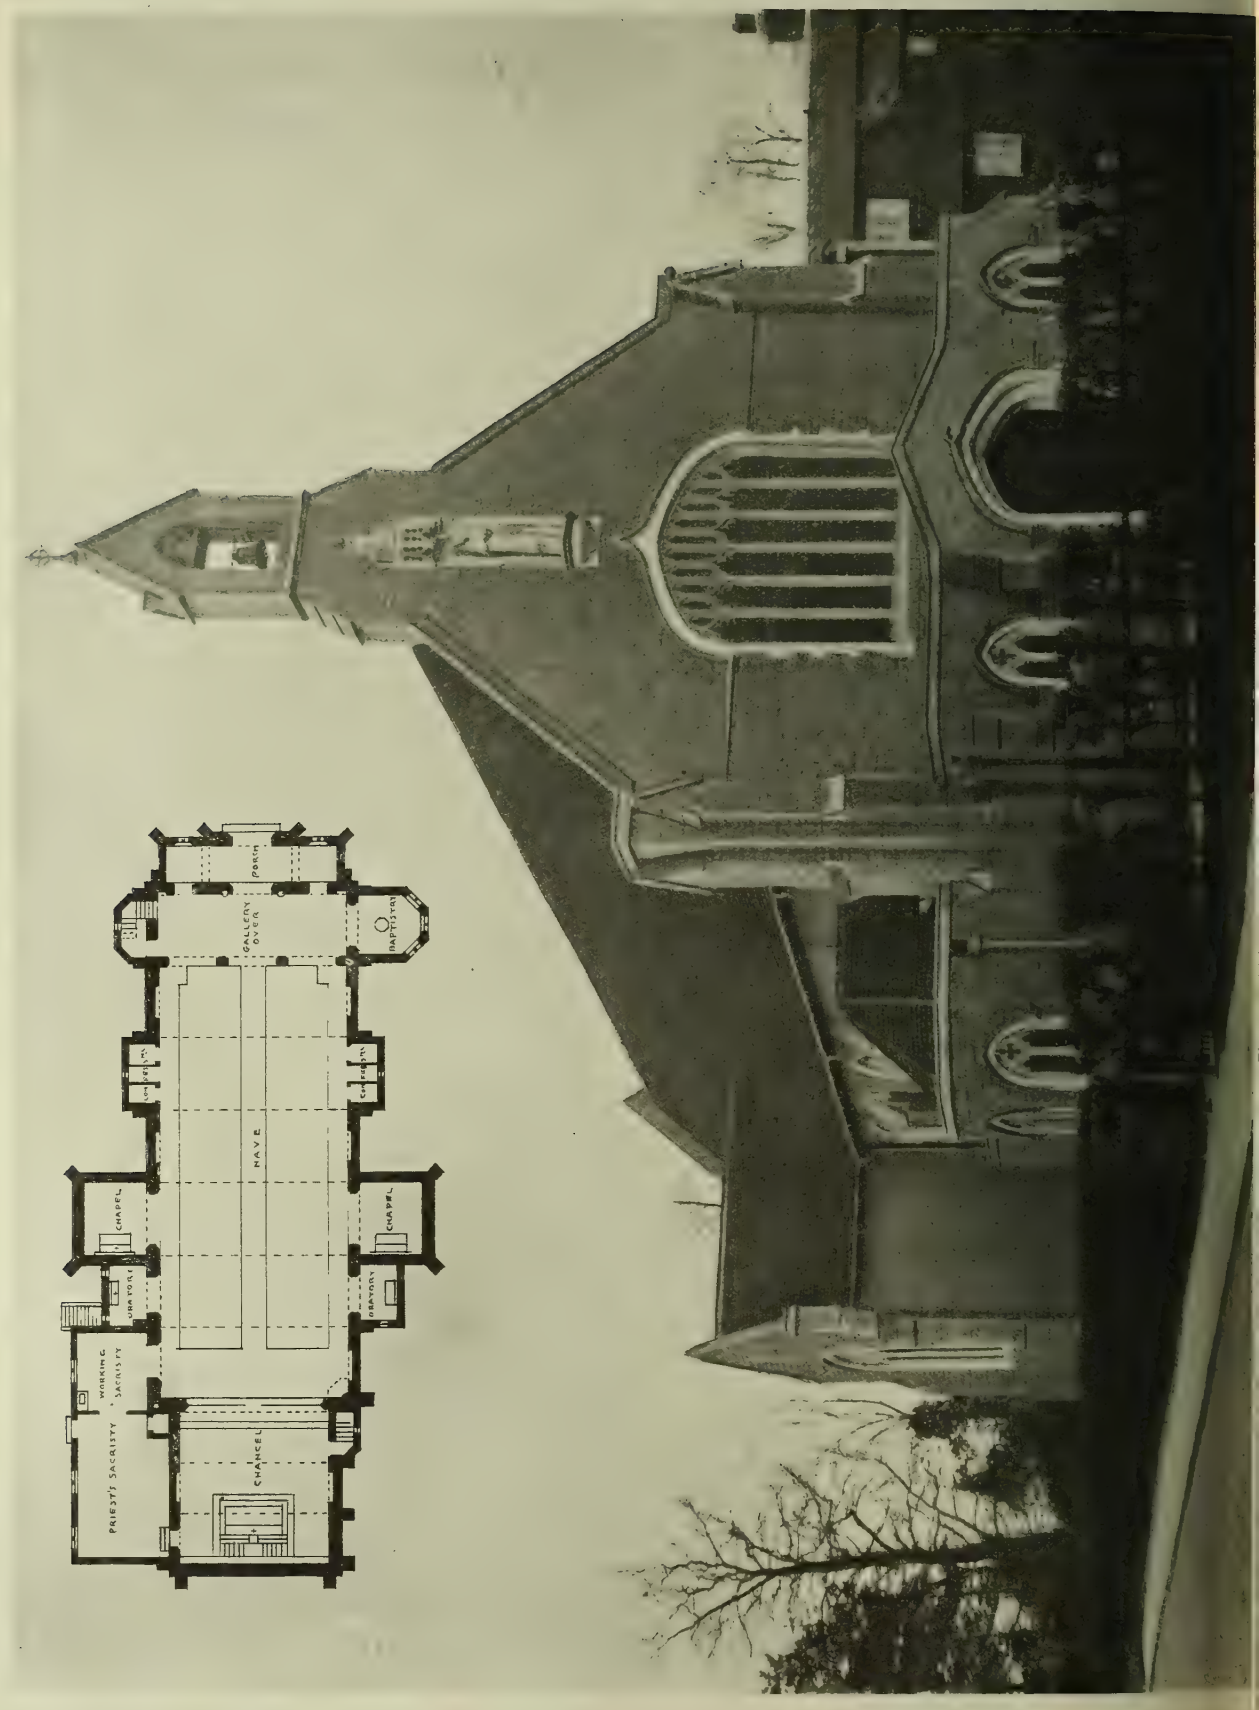
WEDNESDAY, *January* 4.

Edinburgh Architectural Association. Mr. W. S. Purchon on "Beauty in Architecture." 8 p.m.

Royal Institute of British Architects (Children's Lectures). Mr. and Mrs. C. H. B. Quennell on "Everyday Things in the Middle Ages." 4 p.m.

Institution of Heating and Ventilating Engineers. Mr. G. Urquhart Morgan on "Oil Fuel Burning for Central Heating and Domestic Boilers." At Caxton Hall, S.W.1. 7 p.m.

THURSDAY, *January* 5.



Institution of Structural Engineers (Midland Branch). Discussion on "Economics of Floor Construction and Design," introduced by Mr. F. W. Suffield. At Chamber of Commerce, Birmingham. 7 p.m.

Incorporated Institute of British Decorators. Debate on "Are the Existing Relations Between Architects and Decorators Satisfactory?" At the Painters' Hall, E.C. 7 p.m.

FRIDAY, *January* 6.

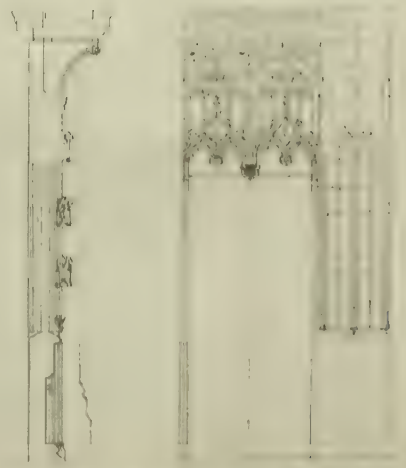
PLAN AND FRONT ELEVATION OF SCREEN

THE STONE ROOD SCREEN IN THE PARISH CHURCH OF ST MARY, TOTNES, DEVON.



CONSTRUCTED OF BEER STONE, THE SCREEN WAS ERECTED ABOUT 1460 TO THE PLANS OF BISHOP LACY, BEFORE THE CHANCEL AND ITS ADJACENT CHAPELS. ORIGINALLY IT SUPPORTED A GALLERY WHICH SEATED THE MONKS OF THE NEIGHBOURING PRIORY OF ST MARY, USED SINCE ITS DISSOLUTION IN 1539, AS THE GUILDHALL. ACCESS TO THE GALLERY WAS GAINED BY A SCREENED STAIR AGAINST THE NORTH WALL OF THE CHANCEL. THE MOULDED WOOD CORNICE REPLACES A FORMER VINE-CARVED ONE OF STONE, REMOVED, WITH THE GALLERY, AT SOME PREVIOUS RESTORATION.

LEGAL SECTION

NOTES ON CURRENT CASES

LIABILITIES AS TO ROADS CONSTRUCTED UNDER PRIVATE ACTS.

THE recent case, Manchester Corporation *v.* Audenshaw Urban District Council and Denton Urban District Council (*Weekly Notes*, November 26), again raised a point arising out of the new demands made upon highways by the modern kinds of traffic. The plaintiff Corporation, under powers conferred by the Manchester Corporation Waterworks and Improvement Act, 1875, had constructed a road which ran through the districts of the defendant Councils, and the action was brought by the plaintiff Corporation to have the measure of their liability as to repair ascertained under section 14, subsection (2) of the above Act. The road in question had been completed in 1878 under the statutory requirements, which included its being carried out to the satisfaction of the defendants' predecessors, which satisfaction had been expressed, and would have been adequate for the traffic then existing for the next 40 years. At that time the district through which the road ran was entirely agricultural, but it had since become industrial, and in about the year 1914 it became apparent that the road, which was an ordinary water-bound macadamised road, would not be able to carry the increased traffic of the district arising from heavy and fast motor traffic. The road rapidly deteriorated, and in spite of increased expenditure on repairs, at the commencement of this action it was in a condition of serious disrepair, and continued so at the time of the hearing. The road was not incapable of being repaired as a water-bound macadamised road, but unless such repair was supplemented by some binding material and spraying the existing traffic would bring about rapid destruction.

The defendants relied upon other sections of the Act, and contended that the plaintiffs were bound to maintain the carriageway in a fit state to bear the ordinary traffic of the present day.

The Court held that the primary obligation of the plaintiffs to construct this road according to the specification in the Act had been duly carried out, and the obligation to repair was coupled in section 14, subsection (ii) of the Act with the provisions specifying the actual mode of construction, and the effect of the Act was to impose upon the undertakers the burden of maintaining the road as constructed, and not to create a liability to supplement, alter, or replace the construction as specified, so as to make it available for the passage of traffic wholly dissimilar from that which the specification was framed to provide for. Thus the plaintiffs were entitled to a declaration that they were only liable to maintain the road in the same condition in which it was when completed in 1878, but if it could be established that any default on the part of the plaintiffs in the years during which they had suspended work on the road had increased the expenditure which would now have to be incurred in restoring it, they would be liable to contribute to the extent of that increase. The Court, in giving this decision, was following a decision of the House of Lords in Sharpness New Docks and Gloucester and Birmingham Navigation Company *v.* Attorney-General (1915, A.C. 654). There, under a private Act, it was provided that the Canal Company should not make a canal across any common highway until they had made such bridges across such highway of such dimensions and constructed in such manner as the Commissioners under the Act should adjudge proper, and all such bridges should from time to time be maintained and kept in sufficient repair by the Company. The canal was made in 1812, and the action was brought in 1914 to determine whether the Canal Company was bound to keep the bridges in such a state of repair that they would bear the ordinary traffic which might be expected having regard to the present needs of the district at the time of the action. The House of Lords held that the liability must be determined exclusively on the wording of the Act, and that no intention could be presumed based on the common law. The Act imposed the obligation to repair such bridges as had been approved by the Commissioners and of the character and fabric thus laid down, and to maintain them in the condition in which they were made, but no obligation was imposed under the Act to reconstruct them so as to bear traffic which, though ordinary, was progressively heavier. This decision was applied by the House of Lords in the case Attorney-General *v.* Great Northern Railway Company (1916, A.C. 356), by a majority, to a bridge erected in 1867 across a highway under section 46 of the Railways Clauses Consolidation Act, 1845, where it was held that the liability of the Company was limited to keeping the bridge in the same condition as to strength in relation to traffic as it was at the date of completion, and the action brought to compel the Company to maintain the bridge in a condition to support the heavy motor traffic which had since become common was dismissed, but Lord Shaw of Dunfermline, who was party to the judgment delivered by the House (from which Lord Haldane alone dissented) intimated that the situation with regard to the accommodation of road traffic resulting from the decision called for interference by the Legislature.

The startling change that has taken place in the nature of traffic upon the highways it can now be seen should have been dealt with by the Legislature beforehand, and not *ex post facto*, but few persons had any conception in the early years of this century of the extent of the development of road traffic. The above cases show that those who undertook under statutory powers to construct and maintain roads are probably the only members of the community who stand in a reasonable position as regards a change in the user of the roads. Their obligations were undertaken to satisfy the existing needs of the community, and a reconstruction to meet demands then entirely unforeseen would have spelt ruin for undertakings already rated for the maintenance of highways.

But the change in the means of transport has increased the burden on many other individuals whose liabilities have not thus been crystallised — the ratepayers, and especially those called upon to make up private streets not yet taken over by the local authorities. In the early days of heavy motor transport the ratepayers got some relief, as the traffic was held "extraordinary traffic," and the special damage caused to the roads had to be paid for (see Abingdon Rural District Council *v.* City of Oxford Tramways, Ltd., 1917, 2 K.B. 318; *The Builder*, June 22, 1917), but "extraordinary traffic" soon becomes ordinary traffic (see Barnsley British Co-operative Society *v.* Worsborough Urban District Council, 1916, A.C. 291: *The Builder*, July 7, 1916), so this form of redress was transitory. The contributions from the road fund, however, now form a relief to the ratepayers, and in future, when constructional work on new roads begins to slacken, may solve the question entirely as regards the ratepayers, but the position of those who have to make up private streets, as we showed in our articles on "The Making up of Private Streets" and on "By-laws" is still very unsatisfactory. The owner of property on a private road is very much in the same position as the undertakers who make a road under statutory powers—he looks at existing conditions when he purchases his property and calculates his ties under those conditions, but so years or more afterwards he may be upon to make up what was a little road to a standard necessary to m capable of relieving the traffic on road (see Chester Corporation *v.* 1924, 1 K.B. 239; *The Builder*, Ma 1924), and the tendency of local autho to demand a high standard in order to themselves from future liability (see and Malden Urban District Council r in *The Builder*, March 26, and com upon in the above articles). The cha any, indicated by Lord Shaw of Dunf in Attorney-General *v.* Great Norther way Company to be effected by legisla not to over-rule the principle laid d that decision but to extend its opera other members of the community.

As we pointed out in the articles w referred to above there is a discret power under section 15 of the Private Works Act, 1892, and now under the Health Act, 1925, section 81, for local rities to contribute to the expenses of up private streets under either the Health Act, 1875, or the Private Works Act, and when the character street is altered it would appear reas that that discretion should be exercise as the power is discretionary, and as al authorities are anxious not to und voluntary burdens this power is practi dead letter. As regards private street at any rate is a direction in which the lature might well move so that, whe vate individuals are called upon to ma streets which from the change in tra local requirements have entirely ch their character, expenditure undertak the benefit of the community should n entirely upon private shoulders but b tributed to as of right by the communi of the rates.

"Open Spaces" and the New La Conveyancing.

What appears a curious point has in the case *In re* Bradford City Pr (*Weekly Notes*, December 3). Und order made in 1924 under Part I Housing of the Working Classes Act, the Bradford Corporation was authori carry out an improvement scheme a acquire land in that area either compu or by agreement, and amongst the hou be acquired were three properties, N 74, and 76, White Abbey-road. Not treat had been given in respect of thes perties and the sale and conveyance ha effected, but at the rear of the premise a yard and ashes place which was ves one Scaife, who was the owner of N and the personal representatives of one who were the owners of Nos. 74 and undivided shares with common rights o by both of them, a not uncommon ar ment in dwelling-houses of this type.

The Law of Property Act, Sched Part V, para (2), provides: "Where diately before the commencement of th an open space of land (with or witho building used in common for the pu of any adjoining land) is held in und shares, in right whereof each owne rights of access and user over the open the ownership shall vest in the Trustee on the statutory trusts which be executed only with the leave Court. . . . ."

A summons had to be taken out by three parties interested to ascertain w this yard under the above provision in the Public Trustee, who was made spondent to the summons, and if tha the case, for leave of the Court to th The Court, in giving its decision, sai the question to be determined was w this yard fell within the above pro

t which it had been said that such a was so absurd that it was incredible he legislature meant anything of the and some limitation must be put on eaning of the words "open space of but neither the definitions of "open " to which the Court had been referred ious Acts, nor anything in the Law of rty Act itself, enabled the Court to ret the words otherwise than in their l meaning, and the result was that this ell within the provision of the Statute open space of land unbuilt upon, with hout buildings used in common for the se of any adjoining land, held in un- d shares. The Court made an order ning the sale.

his case at least the legislation which laimed to simplify the law has put he parties in a trivial case the neces- f applying to the Court, a necessity will arise in every case where a yard ier small space is held in undivided with common rights of access and

men's Compensation: Terminating Weekly Payments.

TION 12 of the Workmen's Compensa- Act, 1925, which purports to limit the of an employer to end or diminish payments has proved very difficult to ue, and has been pronounced by the s, including the House of Lords, to be bscure. In our Legal Section, May 27 we referred to two decisions on this n given by the House of Lords in Ocean Company, Ltd. *v.* Davies (1927, A.C. and Niddrie & Benhar Coal Company e (1927, A.C. 299). It will be remem- that the section commences: "An em- shall not be entitled otherwise than in nce of an agreement or arbitration to diminish a weekly payment except in llowing cases." Then follow the cases here a workman in receipt of weekly nts in respect of total incapacity has ly returned to work; (2) where the earnings of a workman in receipt of kly payment in respect of partial in- ty have actually been increased; and here the special procedure provided for nce to a medical referee has been ed. The difficulty that has arisen in ction with the section arises from the hat it has been held that it is not lsory on the parties to resort to the dure provided in this third case and to the case to the medical referee (Pudney illiam France Fenwick & Co., 1925, 3. 346; Smith *v.* Leach, 1925, 1 K.B.

se cases were in fact supported in Coal Co. *v.* Davies where Lord Shaw nfermline referred to the last proviso e section: "Nothing in this section be construed as authorising an employer d or diminish a weekly payment in any in which or to the extent to which from this section he would not be en- to do so," a cryptic provision which ble Lord considered evidence that there ases apart from the section altogether the employer would be entitled to end y payments. Those cases are by agree- or arbitration. The facts in the Ocean case were briefly as follows: The work- had been certified as suffering from gmus as from October 17, 1923, and full ensation had been paid until November 924, and reduced compensation to Sep- er 3, 1925, when the employers had ed the weekly payments and had on mber 21 applied for arbitration. Before rbitration was held on October 27, 1925. rorkman had admitted that he had re- ed from his incapacity, but he claimed ensation down to the date of the hear- and award. Both the County Court e and the Court of Appeal had allowed claim, but the majority of the House of s reversed those decisions, holding that rinciple of the Act is that compensation be payable only during incapacity, and had been admitted that incapacity had ceased when the payments were stopped the County Court Judge had no jurisdiction to award compensation after that date. A case has recently come before the Courts on facts very similar to those in the above case in Catton *v.* Ashwell & Nesbit (*Times*, December 3).

On August 1, 1925, a workman had sustained injury by accident and had been paid £1 10s. as compensation. In May, 1927, he was examined by a medical man who reported that he had recovered from the injury, and on June 24 the employers stopped the weekly payments, and filed an application for a review by arbitration. On June 27 they were informed by the registrar that the application would be heard on October 14, and they paid into Court the amount of the weekly payments up to that date with a denial of liability. The proceedings then taken were of a somewhat unusual character, as the workman commenced an action in the High Court claiming a declaration that the defendants by stopping the weekly payments on June 24 otherwise than by agreement or arbitration had committed a breach of their statutory duty, and an injunction was claimed restraining the defendants from continuing the breach and damages were claimed. It appears that on behalf of the plaintiff it was endeavoured to distinguish this case from Ocean Coal Co. *v.* Davies on the ground that there it was admitted that incapacity had ceased whilst here the workman alleged continuing incapacity. The Court held that the fact whether incapacity had ceased or was continuing could only be determined by arbitration under section 21 of the Workmen's Compensation Act, and the only point to be decided was the true construction of section 12, and the result of the decisions of the House of Lords in Ocean Coal Company *v.* Davies and Niddrie & Benhar Coal Co. *v.* Dee was that there was no cause of action for a breach of statutory duty which the plaintiff could maintain in the High Court until it was proved in the arbitration that incapacity continued during the relevant period.

In Niddrie & Benhar Coal Co. *v.* Dee the employers had attempted to resort to the third method provided by section 12, viz., a reference to the medical referee, but their application had been refused under section 19, subsection (2) of the Act on the ground of the exceptional difficulty of the case, and pending arbitration the workman had sought to levy execution for the payments alleged to be due. The employers had paid the sum in dispute into Court, and the House of Lords had ordered a stay of the execution pending arbitration.

The decisions show that payments can be stopped if an arbitration is applied for; therefore when employers stop payments they should be careful to apply for arbitration at the same time.

But if there is an arbitration, and recourse is not made to the third case mentioned in section 12, a question arises as to the power of the employer to pay the sum in dispute into Court with a denial of liability, a course adopted in the case we are considering, but which, owing to the nature of the decision, it was unnecessary to decide. This point was referred to in both Ocean Coal Co. *v.* Davies and Niddrie & Benhar Coal Co., and the legislation was criticised on the ground that, although it provided for the sum being paid into Court, and being paid to either party where, under the procedure denoted in the third case in section 12, the case went to reference to the medical referee, other cases were not provided for. In the first of the above cases Lord Wrenbury dealt with the point thus:—"Assume that the employer has opened the ball by serving on the workman a notice of his intention to end the weekly payment; the first possible event is that the workman takes no action. In that case the employer can stop payment at the end of the ten days. The second possible event is that the workman, within the ten days, sends to the employer a medical report that he has not recovered or has only partially recovered; in that case the employer can only end or diminish the weekly payment in accordance with the report which the workman has obtained, or such modification as the employer can obtain from a medical referee. But here, again, two alternatives arise. The matter may (*a*) go on as a medical reference or (*b*) it may not. The Court, under section 19, subsection (2), may send the matter to arbitration and refuse to allow the medical reference if it finds exceptional difficulty or other sufficient reason for doing so. In case (*a*) certainly, and as I think in case (*b*) also the employer may pay into Court instead of paying the workman, but only in case (*a*) does the Act provide that the money in Court shall be paid out to the winning party." These observations, although they occur in the Ocean case, really refer to the Niddrie case, and in the Niddrie case it was definitely decided that, in what was described above as case (*b*), the money could be paid into Court, and that when the arbitration had been held the Court had power to deal with the money in Court in such manner as it deems right. But this decision does not directly cover the case where, as in the Ocean case, no resort is made at all to the procedure indicated in case (3), or the case we are considering, where also case (3) procedure was not resorted to, but a payment was made into Court, because in the Niddrie case the employers had attempted to follow that procedure and go to the medical referee, but were prevented from doing so by the order of the Court. The difficulty is that the provision for payment into Court with a denial of liability is only contained in the Act where the matter actually (under case 3) goes to the medical referee; and the cases where payments are stopped subject to arbitration are not provided for, and at present no case has been decided directly on the point. The decision in Niddrie & Benhar Coal Co. appears to indicate that in these cases payment could be made into Court, but the judgments are in the nature of dicta, because in that case the proceedings arose in connection with the special procedure provided by case (3) in the section —a reference to the medical referee.

LAW REPORT

Alleged Trespass by Officials.

At Bristol Assize, Joseph John Ballard, a builder, of Old Holly Lodge, St. George, Bristol, sued the Lord Mayor and Corporation of Bristol for damage for trespass arising out of the demolition by Corporation officials of a condemned cottage at Crew's Hole, St. George, Bristol, the property of plaintiff.

Mr. Myddleton Wilshere, for plaintiff, said his client owned some cottages at Crew's Hole, one of which became dilapidated, and a demolition order was served upon him, its execution being postponed in consideration of his undertaking to make certain structural alterations and repairs. He proceeded to carry these out, but the Corporation alleged that he did not comply with their specifications or the undertakings he had given. Correspondence took place between the parties and eventually the officials of the Corporation demolished the property under the order. Mr. Ballard estimated that he had spent £300 on the property, and having lost that through the property being demolished, he claimed damages accordingly.

On behalf of the Corporation, Mr. E. H. C. Wethered contended that there was no cause of action, and no case for him to answer, as there had been no irregularity, the demolition having been carried out in accordance with the powers with which the Corporation was vested.

This contention was upheld by the judge, Mr. Justice Shearman, who said that the exercise of the powers under the related Acts of Parliament was left to the discretion of the local authority, and their decision was final. The evidence on which they acted could not be reviewed in the High Court. Therefore as there had been no irregularity there was no trespass. He gave judgment for the Lord Mayor and Corporation, with costs.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Cedar Wood.

Sir,—I should like to hear if any of your readers have had experience in the use of cedar wood for joinery finishings, and whether it stands well for this purpose in this climate.

Practice.

Fuel for Central Heating.

Sir,—What are the comparative advantages of oil against coke, used in central heating for a medium-sized house? The experience of any of your readers would be welcome.

S. Whitelock & Co.

Lino Cement.

Sir,—I should be greatly obliged if some reader would kindly tell me the best method and material for sticking down lino to counter-tops, taking into consideration the fact that during cleaning operations the counter-top is flooded with water, and that the underside of counter-top is subject to steam from wash-ups. I have tried several kinds of lino-cement, glue, glue and plaster of Paris, but with no very great success.

Charles Causebrook.

Basement Houses.

[Reply to "Victorian," November 11.]

Sir,—In the issues of *The Builder* for November 23, December 7 and 14, 1878, is a series of articles from a correspondent, signed "C," in which he reviews the "New Building By-Laws for London," under the "Metropolitan Management and Building Acts (Amendment) Bill," 1878. Under 41 and 42 Victoria, ch. 32, paragraph vi, section of No. 2 of the suggested By-Laws reads: "Every wall of a house or building shall have a damp-course throughout its whole thickness of asphalt or other material impervious to moisture, at a height of 12 in. above the base of such wall where there is no basement story, and at a height of 12 in. above the level of the ground where there is a basement or half-basement story."

As this was 50 years ago, it practically answers "Victorian's" query. The By-law made it a compulsory measure, although damp-courses had been used prior to this date, but not in a general sense. It was a matter left, doubtless, to the architect or builder, and many houses and buildings were built without a damp-course being provided. Very few damp-courses are found during the demolition of houses over 60 years of age. Lead damp-courses are rarely found. Asphalt and slates set in cement are the most frequent.

Frank Jay.

Condensation on Shop Windows.

[Reply to "Troubled," December 16.]

Sir,—Since condensation on the shop window is due to the moisture-laden air coming in contact with the cold glass surface, the obvious remedy is either (1) to keep the inner surface of the window warm, or (2) to get rid of the moisture-laden air.

No. 1 is certainly not good, because the different temperatures on the outside and the inside of the glass pane will set up stresses in the glass and probably cause it to crack. No. 2 is the more effective, and is obtained by having an air-tight enclosure around the window. The air in the enclosure can then be dried either by placing in it some good moisture absorbent, such as anhydrous calcium chloride, or by removing the air by a suction fan and drawing fresh air in through drying tubes containing the above absorbent.

Burning gas jets, suggested by "Heatum," only causes more moisture to be formed, though it may, of course, keep the inside of the glass warm and so prevent condensation. At night, however, when the gas is turned out, condensation on the glass will most certainly take place.

G. L. Imsea.

Teak Table Tops in Chemical Laboratories.

[Reply to Mr. H. Munro Cautley, October 28.]

Sir,—The following recipe has been used by the writer quite successfully for acid-proofing the surfaces of tables in the laboratories of the Medical College, Madras, South India, and the surfaces treated three years ago are still in good condition:—

Solution 1.—Ferrous sulphate, 20 grammes; copper sulphate, 20 grammes; potassium permanganate, 40 grammes; water sufficient to make 500 c.c. Apply two coats of this with an interval of at least 12 hours. When thoroughly dry, apply two coats of No. 2 solution.

Solution 2—Aniline oil, 60 c.c.; strong hydrochloric acid, 90 c.c.; water sufficient to make 500 c.c. When the treated surface is thoroughly dry, apply one coat of raw linseed oil with a cloth. After this is dry, wash with very hot soap-suds. The excess of black should be washed off after 48 hours with soap and plenty of water. Occasional washing keeps the surface quite clean. The surface to be acid-proofed should be quite fresh, or, if previously coated with varnish, oil or paint, it should be thoroughly scraped and cleaned.

S. Siva Rau,
Assistant Engineer,
Madras, S. India, Public Works Department.

WEEK IN PARLIAMENT

Westminster, *Wednesday.*

Parliament was prorogued on Thursday, December 22, until Tuesday, February 7.

Housing Progress.

The King's prorogation speech referred to the striking progress that had been made during the past year in providing housing accommodation for the people. The number of new houses built in England and Wales since the Armistice now exceeded 1,000,000. More new houses had been built in Scotland this year than previously, and substantial progress had been made in slum clearance and re-housing schemes.

British-made Bricks.

Mr. Chamberlain informed Gen. Makin that the prices of bricks varied according to grade and locality. According to the reports published from time to time by the Interdepartmental Committee appointed to survey the prices of building materials, the price of Fletton bricks at Willesden in April, 1914, was 22s. 6d. per thousand. The corresponding price at Willesden at the present time was 55s. The imports of bricks of earth or clay during the last three years, and the average declared value, were as follows:—

Year	No.	Average declared value per 1,000 (c.i.f.) shillings.
1925	158,900,000	..... 56.46
1926	228,892,000	..... 56.95
1927 ..... (Jan.-Nov.)	263,290,000	..... 50.94

Rent Acts and New Houses.

Sir Basil Peto asked the Minister of Health whether he could state the total number of new houses which had been built, the rents of which were uncontrolled; the number of old houses the rents of which had been decontrolled; and the number of houses with rents still controlled under the Increase of Rent and Mortgage Interest (Restriction) Acts.

Mr. Chamberlain said that the Rent Acts did not apply to new houses erected after or in course of erection on April 2, 1919, or to houses which had been since that date or were at that date being bona fide re-constructed by way of conversion into two or more separate and self-contained flats or tenements. The number of new houses erected to which the Acts did not apply was approximately 1,050,000, but he had no particulars of the number of houses which had been converted. Statistics were not available of the numbers of houses which had been decontrolled and the numbers which were still controlled.

Loans for Working-Class Houses.

Mr. Wardlaw-Milne asked the Chancellor of the Exchequer whether he would consider the question of raising a Government housing loan with a view to helping the smaller local authorities to build working-class houses, or of extending the activities of the Public Works Loan Board for that purpose so as to enable small local authorities to borrow on more advantageous terms than they could obtain at present.

Mr. A. M. Samuel, the Financial Secretary to the Treasury, who replied, said that the resources of the Public Works Loan Board were in the main reserved for the smaller local authorities. Since April 1, 1920, they had lent for the purposes of the various housing Acts £195 millions, and in the current year about £29 millions to the local authorities. The loans were made on terms which represented the actual cost of the operation. In view of those facts there would appear to be no ground for Mr. Milne's suggestion.

Palace of Westminster.

Sir W. Davison asked the Under Secretary of State for the Home Department, as representing the First Commissioner of Works, whether immediate steps could be taken to replace the top of the central tower of the Palace of Westminster, which in its present truncated condition was a serious disfigurement to the whole building as viewed from Whitehall and Trafalgar-square, without waiting for the carrying out of the complete scheme of necessary repairs.

Sir S. Henderson said it was, of course, impossible to commence operations on the central tower until the stones to be used for the whole of the building had been selected, but the First Commisioner agreed that the portion of the building should be dealt with at any early date.

THE PROPERTY MARKET

In their Report for the year now ended Messrs. Yates & Yates, the estate agents and surveyors, of Hanover-square, state that the past year has shown a very marked improvement over 1926, which suffered from the General and Miners' Strikes. According to the review of this firm, whose activities are mainly concerned with the London area, nearly all branches of the property market shared in the increased prosperity, but none more so than building sites.

A large proportion of these areas are destined to support new blocks of mansion flats. Cinemas and theatres continue to absorb certain picked positions in the West End and prosperous suburbs; while a new and vigorous competition for large sites is provided by garage and motor-service station propositions. Shop properties in important and improving positions have been a fairly ready market throughout the year, despite the constant addition to the supply from new buildings; and rentals have, if anything, increased, and will, in the opinion of the firm, go still higher on any appreciable improvement in the general trade and prosperity of the country. The same remarks apply to upper parts, which are gradually being absorbed by firms appreciative of the convenience and prestige of up-to-date offices and showrooms.

A development worth noting has been the increasing interest shown by the general public in property as a means of investment, which is reflected in the flotation of several large property-holding companies.

THE BUILDING TRADE

INTS IN CONNECTION WITH THE LAW OF LANDLORD AND TENANT—X.

Consent to Assignments.

ENANTS restricting the assignment -letting and parting with the possession emises usually contain a condition that rohibition is limited to so acting with- he consent in writing of the landlord sor, which consent shall not unreason- be withheld, and as we have before in- d, the Landlord and Tenant (No. 2) ecognises this as it contains a provision n leases made after the Bill becomes ovenants containing a condition against ing, under-letting, charging, or part- with the possession of the demised ses shall have implied in them a proviso the licence or consent is not unreason- o be withheld, notwithstanding any ex- provision to the contrary.

practice it is very common to find such ants drawn first prohibiting assignment ut consent and then providing "such nt not to be unreasonably withheld in ase of assignment to a respectable and nsible person," but if the covenant is awn it may limit the provision that the nt shall not be unreasonably withheld one case where the proposed assignee's tability or responsibilty is in question. ates *v.* Donaldson (1896, 2 Q.B. 241), the covenant was drawn in this form. Justice A. L. Smith said: "It will be that it is only when a respectable and nsible person is proposed as assignee or -tenant that this clause as to the per- n not being unreasonably withheld into play. If the person proposed be respectable and responsible person the has an absolute right to refuse permis- if, however, the person proposed be table and responsible, then the lessor t unreasonably withhold his permission" uld the above Bill become law in its nt form, the point would cease to have tance, but as the law stands we think est form of covenant would be to the ring effect that no assignment, under- g, etc., shall not be made without the us consent in writing of the landlord or such consent not to be unreasonably eld, nor withheld in the case of a re- ble or responsible person. It is true f a respectable and responsible person offered the word "unreasonably" would to a refusal in his case, but we add tter words in order that the covenant fall within the decisions delivered by Courts under the covenant in the form , as we have shown above, has very been adopted.

vider interpretation has, however, been to the covenant even in that form might be implied from the above ob- ions of Lord Justice A. L. Smith, as all show below under the heading what easonable grounds for withholding con- but before considering that question we efer to a case, Lewis & Allenby (1909, . Pegge, 1914, 1 Ch. 582), which shows peration of the covenant where no ds were given for refusal. In that case covenant provided that the premises d not be assigned, underlet, nor the ssion thereof be parted with without onsent of the landlords being first ob- d, such consent "not to be withheld in ase of a respectable and responsible per- The Company had demised a residen- lat to the defendant, and on April 3, the defendant had applied to the secre- of the Company for leave to sublet to son who admittedly was "respectable responsible," and the secretary had sed to bring the matter before his d. No reply having been received in nterval, on April 14 the defendants exe- an underlease to the person named. n action by the Company to recover possession for breach of the covenant the Court held that where the proposed assignee or undertenant was a respectable and responsible person, although consent must be asked, for it was a mere formality, and where an answer was not received within a reasonable time that amounted to a refusal of consent. The time which had elapsed between April 3 and April 14 was a reasonable time within which to ask for a reply, and the action must be dismissed with costs. This case followed the principle laid down in an old case, Hyde *v.* Warden (3 Ex. Div. 72), where the covenant was in similar terms.

What are Reasonable Grounds for Refusing Consent?

In Bates *v.* Donaldson, a case we have mentioned above, the covenant was a prohibition against assigning without consent, "such permission or licence not to be unreasonably withheld in the case of a respectable and responsible person," and it was held that refusal to an assignment to a person who was respectable and responsible could not be withheld in order to enable the lessor to regain possession of the premises before the termination of the term granted, and the action to recover possession for breach of contract in assigning without consent was dismissed.

This case was followed in *In re* Winfrey and Chatterton's Agreement; Chatterton *v.* Evison (1921, 2 Ch. 5; *The Builder*, March 25, 1921). The covenant was in the same form as in the previous case, and a respectable and responsible tenant was proposed, but the defendant who had purchased the freehold reversion desiring the house for her own occupation had offered to purchase the remainder of the lease from the plaintiff and had withheld her consent to the assignment. The Court held that these covenants were inserted in order to protect the lessor from having his premises used or occupied in an undesirable way or by an undesirable person, and not to enable the lessor to coerce a tenant to surrender a lease so that possession might be obtained of the premises, and an order was made that the assignment could be made without the licence of the lessors. The real reason for refusal was much the same as in Bates *v.* Donaldson as there had been negotiations for a surrender of the lease.

This brings us to the latest decision on this point by the Court of Appeal in Houlder Bros. & Company *v.* Gibbs (1925, 8 Ch. 575; *The Builder*, February 27, 1925). In that case the lease provided that the lessee without the consent of the lessors first obtained should not assign, underlet, etc., the premises or any part thereof, "such consent not to be withheld unreasonably in the case of a respectable and responsible person or corporation." The lessees, the plaintiffs, desired to assign the premises to Roneo, Limited, but the defendants withheld consent, not that they objected to Roneo as good tenants, but on the ground that Roneo were tenants, as yearly tenants, of an adjoining house of the defendants, and if the assignment were consented to the defendants would lose Roneo as tenants, and there would be difficulty in finding another tenant for the house.

The question raised was whether, in determining the refusal to be reasonable or unreasonable, the Court can regard all the extrinsic circumstances which influenced the refusal, however disconnected they may be with the personality of the proposed assignee and the user he may make of the premises, or whether the reasons given must have some relation to the personality of the assignee and the proposed user of the premises, and in the Court below it was said this point had never been definitely decided, although there had been numerous dicta on the point.

The Court considered the decided cases, and amongst them Bates *v.* Donaldson (*ubi sup.*), and preferred the following statement of the law in that case by Lord Justice A. L. Smith to a passage relied upon from the judgment of Lord Justice Kay. That statement of Lord Justice A. L. Smith was: "It is not, in my opinion, the true reading of this clause that the permission can be withheld in order to enable the lessor to regain possession before the termination of the term." (Then follow the words particularly relied upon.) "It was, in my judgment, inserted *alio intuitu* altogether, and in order to protect the lessor from having his property used or occupied in an undesirable way or by an undesirable tenant." Thus the Court of Appeal held that the refusal must be connected with the relationship of landlord and tenant as created by the lease in reference to the subject-matter of the demise.

It will be seen this interpretation is wider than that we indicated at the commencement of this article, as it is not confined to the mere question of the respectability or responsibility of the proposed assignees, but includes the intended user of the premises. Perhaps one of the most extreme cases is Governors of Bridewell Hospital *v.* Faulkner (1892, 8 T.L.R. 637), where consent was refused to assign to "General Booth," of the Salvation Army, on the ground that his occupation might be deleterious to other property of the lessors, although an assurance had been given that the premises would be used for offices only and not for meetings. Words in the covenant there were introduced that consent should not be withheld "without good and sufficient reason," and evidence was given that the other property of the lessors would be deteriorated, and the refusal was held to have been reasonable. Lord Justice Warrington, in Houlder *v.* Gibbs, referring to this case, pointed out that the damage which was apprehended would have resulted, if it resulted at all, from the personality of the assignee and the user of the premises. The distinction between that case, therefore, and the ground upon which consent was withheld in Houlder *v.* Gibbs is clear, for in the latter case the refusal had no connection with the premises demised, but was solely based on the apprehended loss of a tenant of other premises unconnected with the user of the premises demised, and outside the relationship of landlord and tenant.

In Ideal Film Renting Company *v.* Nielson (1921, 1 Ch. 575; *The Builder*, March 25, 1921), the Company were holders of two underleases which contained covenants restraining them from assigning, etc., without consent, such consent not to be withheld in the case of a respectable and responsible person. Owing to increasing business and the need of more capital, resolutions were passed for a voluntary winding-up of the company with a view to reconstruction, and a liquidator had been appointed to enter into an agreement with a new company. The capital of the old company, when it was incorporated in 1913, was £5,000. The new company was incorporated in 1920 with a capital of £115,000, subsequently increased to £172,000, all paid up. Since 1914 the old company had carried on a film-producing as well as a film-renting business, and the business was to be carried on with the same staff and in exactly the same way. When the liquidator applied to the defendant, the lessor, for consent to the assignment to the new company, consent was withheld on the two main grounds that it was a new company which so far had not carried on business, and that it was about to engage in speculative business—film-producing. The Court held that as the position of the new company had been explained to the lessor, and it had been shown that the business to be carried on was practically the same, the lessor had taken up an unreasonable position, and a declaration was made that the plaintiff company could assign without leave.

THE LANDLORD AND TENANT (No. 2) BILL

We may very briefly note the principal alterations made in the Landlord and Tenant Bill in Committee in the House of Lords. Under clause 1 the compensation for improvements is not to be "the capitalised value of the net addition to the letting value of the holding as a whole . . ." but "the net addition to the value of the holding as a whole . . ." and in subclause (2), in determining the value attributable to this net addition, not only the proposed demolition of the building is to be regarded, but also any structural alterations, and "regard shall be had to the effect of such demolition, alteration, or change of user on the additional value attributable to the improvement." We only note the actual words altered or inserted. Under clause 2 the landlord is allowed two months in place of one month to offer the tenant a renewal of the tenancy.

In clause 3 a new subclause has been added numbered (2) as follows: "In considering whether the improvement is reasonable and suitable to the character of the holding the tribunal shall have regard to any evidence brought before it by the landlord or any superior landlord (but not any other person) that the improvement is calculated to injure the amenity or convenience of the neighbourhood."

In subclause (4), where no objection has been raised to an improvement or it has been sanctioned by the tribunal, a third case has been added to the proviso which restricts the tenant from carrying it out, viz.: if it infringes a restriction imposed "for securing any right of the public over the foreshore or bed of the sea." A new subclause numbered (6) has also been added to this clause: "Where a tenant has executed an improvement of which he has served notice in accordance with this section and with respect to which either no notice of objection has been served by the landlord, or a certificate that it is a proper improvement has been obtained from the tribunal, the tenant may require the landlord to furnish to him a certificate that the improvement has been duly executed; and if the landlord refuses, or fails within one month after the service of the requisition to do so, the tenant may apply to tribunal, who, if satisfied that the improvement has been duly executed, shall give a certificate to that effect. Where the landlord furnishes such a certificate, the tenant shall be liable to pay any reasonable expenses incurred for the purpose by the landlord, and if any question arises as to the reasonableness of such expenses it shall be determined by the tribunal."

In clause 4, which relates to compensation for goodwill, an important addition has been made to subclause (1) (*d*) which covers a point we have raised in our articles. That clause provided: "The tribunal shall, in determining the amount of compensation for goodwill (i) have regard to the intentions of the tenant as to carrying on the trade or business elsewhere," but now to this has been added: "and may make it a condition of its award that the tenant shall undertake not to carry on the trade or business within such distance of the premises as may be specified in the award."

An addition has also been made to paragraph (*e*) of this subsection. That paragraph provided that the tenant should not be entitled to payment of compensation for goodwill if he himself had terminated the tenancy or failed to exercise an option for a further term contained in the lease or in a collateral agreement; to this has been added the qualification, "unless in the case of an option the terms of the option are such that the tenant could not reasonably be expected to exercise it."

In clause 5 there are numerous small drafting amendments, but the only one requiring notice appears to be a new time limit inserted in subclause (2). Where notice has been given by a tenant that compensation for goodwill under clause 4 will not compensate him and in lieu of such compensation he applies for a new lease, it was provided in the Bill that the application to the tribunal to determine whether the grant of a new lease would be reasonable had to be made "not less than nine months before the termination of the tenancy"; to this has been added "or where the tenancy is terminated by notice within two months of the service of the notice." Subclause (8) is amended so as to provide for a claim for a new lease not being made in respect of goodwill attaching to the premises not only during the currency of a new lease but also during a renewal of a lease granted in lieu of compensation under clause 4.

A new clause numbered 7 has been added to the Bill which provides "Where in respect of any holding a claim for compensation has been made both for improvements and for goodwill and the landlord has offered in lieu of compensation for either such claim to grant to the tenant, or obtain the grant to him, of a renewal of the tenancy, the rent under such renewal shall be fixed irrespective of any increased value of the premises attributable either to the improvements or to the goodwill."

Clause 8, which relates to the rights of mesne landlords, has been amended at the end, and now reads: "Where more than one landlord is concerned and they do not agree whether an offer of the renewal of the tenancy in lieu of compensation for an improvement or for goodwill should be made, the matter shall be referred to the tribunal and the decision of the tribunal as to whether or not any such offer is to be made shall be binding on all the landlords concerned"; and a new subclause has been added: "In this section reference to a landlord shall include reference to his predecessors in title."

The right of entry given to a landlord by clause 9 has been amended (see now in clause 10) by defining the purposes of entry, *i.e.*, "for the purpose of executing any improvement he has undertaken to execute and of making any inspection of the premises which may reasonably be required for the purpose of this part of the Act," that is, Part I.

A new subclause has been added to clause 16 of the Bill after subclause (1) (which in the Bill as amended is clause 17, subclause (2)), which provides "this part of this Act shall not apply to any holding let to the tenant during his continuance in any office, appointment or employment, or for the temporary convenience or to meet a temporary necessity of either the landlord or the tenant, provided that any such contract of tenancy made after the commencement of this Act shall be in writing signed by the parties thereto and shall express the purpose for which the tenancy is created." This concludes Part I. of the Bill.

The amendments introduced into Part II. are mainly drafting amendments, except that mining leases are excluded from the operation of clause 18 (now clause 19) in subclauses (2) and (3), which relate to covenants against assigning, and there is a new subclause to clause 19 (now clause 20) dealing with applications for apportionment of rents where the reason for the application is due to any action taken by a person other than the applicant.

As regards Part III., we have already in a previous article outlined the important, and in our opinion desirable, changes effected in the tribunal which will do away with the objections raised to this part of the Bill.

In the last clause of the Bill containing the definitions, the definition of "landlord" has been amplified as follows: "The expression 'landlord' means any person who under a lease is, as between himself and the tenant or other lessee, for the time being entitled to the rents and profits of the demised premises payable under the lease." The use of the word "lease" here at first sight appears curious, as the Bill applies to tenancy agreements other than leases, but it has to be read in conjunction with the interpretation of the word "lease" in the same clause which includes "lease, underlease or other tenancy," a somewhat clumsy expression. There is a definition now in the Bill of "statutory company" as meaning "any company constituted by or under an Act of Parliament to construct work, or to carry on any gas, water, electricity, tramway, hydraulic power, dock, canal, or railway undertaking; and the expression "public utility company" means any company within the meaning of the Companies (Consolidation) Act, 1908, or a society registered under the Industrial and Provident Societies Acts, 1893 to 1913, carrying on any such undertaking." It seems impossible to escape legislation by reference, although until this last clause the Bill is fairly free from it.

The expression "prescribed" now instead of meaning "by regulation made by the Reference Committee" means prescribed by County Court rules.

By a new subclause "the designation of landlord and tenant shall continue to apply to the parties until the conclusion of any proceedings taken under or in pursuance of this Act in respect of compensation."

Lastly, the date the Bill is to come into force has been changed from September 30, 1927, to March 26, 1928.

TOWN PLANNING.

The following progress in town planning in England and Wales for the month ended November 30, 1927, is recorded by the Town Planning Department, Ministry of Health:—

Town-planning scheme submitted (Stage C).

Essex: Rochford R.D.C. (Rawreth No. 1).

Preliminary Statement approved (Stage BB).

Oxfordshire: Oxford T.C. (Regional and Special Areas 1 and 2).

Preliminary Statements submitted (Stage B)

London: London C.C. (Nos. 5 and 6).

Nottinghamshire: Nottingham T.C. (Parts 3 and 4).

Staffordshire: Leek U.D.C.

Surrey: East and West Molesey U.D.C.

Sussex: Eastbourne T.C.

Resolutions received (Stage A).

Derbyshire: Long Eaton U.D.C.

Essex: Chelmsford R.D.C. (No. 3).

Kent: Folkestone Jt. Committee.

Middlesex: Uxbridge U.D.C.

Northumberland: Newcastle-on-Tyne T.C. (East Central Area).

Somerset: Taunton T.C.; Taunton R.D.C. (Taunton T.C.).

Surrey: Barnes U.D.C. (No. 2); Kingston T.C. (Maldens and Coombe U.D.C.); Maldens and Coombe U.D.C. (No. 2).

Sussex: Brighton T.C.; Newhaven R.D.C. (Brighton T.C.); Southwick U.D.C. (No. 2).

Yorkshire (West Riding): Great Ouseburn R.D.C.

Elizabethan Hall at Barnet.

The Visitors of Jesus Hospital have resolved, subject to the Charity Commissioners' approval, to purchase for £1,750 the Elizabethan hall which for three and a half centuries has formed part of Queen Elizabeth's Grammar School, Barnet. In this hall are a dunce stool and whipping post. The grammar school is to be superseded by a new county secondary school, and it was feared that the site would pass into the hands of builders. Largely through the good offices of Lord Strafford, Chairman of Jesus Hospital, the hall will be preserved as a local museum and as offices for the Visitors.

For rates of wages in the Building Trade in Scotland, see page 1032.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed, that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, etc., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Housing in London.

A meeting of the housing associations in London that lately appointed a deputation to wait on the Prime Minister in regard to the housing of the poorest sections of the wage-earning classes was held on December 8 at the Mansion House under the chairmanship of Sir Willoughby H. Dickinson. The committee originally appointed to arrange the deputation was reappointed with four additional members, and requested to carry on the propaganda with the advisory help of a larger committee representative of local, denominational, and other housing associations interested in the movement.

Burst Pipes.

Dealing with this subject, the *Times* makes the following remarks :—

"Prevention is proverbially better than cure, but unfortunately some architects seem to regard a severe frost as so remote a contingency in this country that often they take little care to guard against it and are content to place the pipes in the most unprotected situations. At the worst they may be on the outside walls, and then the best that can be done is to wrap them with straw or other badly conducting material, though the expedient is not likely to prove efficient indefinitely. If they are placed snugly in the interior, as they ought to be, there is not much chance of trouble, at any rate in a house that is lived in; and if they are inside at all, even in an exposed position, it is surprising how much a small burning gas-jet or a lamp will do to prevent freezing up. Houses with central heating, especially if the hot and cold pipes are sensibly arranged close to each other, are practically immune. It is said that if pipes were made oval in section, instead of round, they would not burst when water was frozen in them. That application of science to practice may come in time, but pending its adoption the best preventive is to take thought to place the water services in positions where they are reasonably well protected from the weather. If that is done they have a good chance of resisting a protracted frost in a well-built house, even if it is unoccupied and there are no fires in it."

THE SCOTTISH BUILD

GLASGOW TOWN-PLANNING

An extensive town-planning scheme, covering an area of almost 4,000 acres in the western district of Glasgow, is under the consideration of Glasgow Town Council. The draft plans prepared by the city engineer include nine large estates, as well as the Corporation housing areas at Knightswood and Kelvindale. Of the area, nearly 1,500 acres are undeveloped land, and of that it is proposed to utilise 950 acres for residential purposes, with a density ranging from 12 to 36 houses per acre, 20 acres for business premises, 64 acres for industrial premises, 157 acres for recreational purposes, 37 acres for new streets and street widening, with 230 acres left undetermined meantime.

The Corporation Statute Labour Committee have generally approved of the draft town-planning scheme affecting numerous estates and comprising 3,786 acres, of which 1,372 acres in Renfrewshire and Dumbartonshire come within the city area through the recent extension of the boundaries.

In his report the city engineer points out that the question of cross-river communication should also be considered along with the scheme. He directs attention to a recent suggestion by him to the effect that any cross-river communication west of the proposed new high-level bridge at Finnieston would require to be by tunnel under the river.

NEW BUILDINGS IN SCOTLAND

Edinburgh.—BUILDING.—The Edinburgh Dean of Guild Court has passed the following :—Messrs. Anderson & Walker — two double bungalows at Templeland-road, Corstorphine; Mr. C. H. Dunlop—three double bungalows at Orchard Bank; Edinburgh Sabbath Free Breakfast and People's Palace Mission Trustees—Mission hall at Old Fish-market Close; Harkness, Beaum Ltd.—warehouse at Ballantyne-ro Mr. Thomas Lister—three sho John's-road, Corstorphine.

Moray.—SCHOOL.—The possibilit school being erected at some futu the outskirts of Bishopmill to serv of both Bishopmill and Spynie has posed by the Moray Education A

Musselburgh.—FACTORY.—Plans proved by the Musselburgh Dean Court for a new factory for wire facture by Messrs. Brunton, M Wire Mills. The cost is estimated

Town Planning in Federated Mal

The Sixth Annual Report of t ment of Town Planning, Federa States (1926), records marked adva preparation and execution of town and housing schemes and legislati rapidly growing country which p substantial portion of the world' rubber supplies. All important to course of improvement and develop various schemes approved by Governments. The activities of th ment embrace many features of modern town planners, including s redistribution. The latest Exhib held recently in the State of Perak (the state capital). It comprised 40 plans, photos, diagrams, placards, etc., illustrating the growth of town from the early days of civilisation modern cities in Europe, Great America, China, Japan, Australia, a Overseas Dominions. The exhibit results of several years of travel an gation in different countries by th ment Town Planner (Mr. Charles M.T.P.I.). A large series of local illustrations of town planning an activities in Kuala Lumpur, Ipoh centres were hung side by side with exhibits.

BUILDING TRADE WAGES IN SCOTLA

Post Office London Directory, 1928.

Messrs. Kelly's Directories, Ltd., 186, Strand, W.C. 2, have issued their Post Office London Directory with county suburbs for 1928. This is the 129th annual edition. It is not necessary to say that this work is invaluable to every business firm or person. A use is found for it every day of the year. The area covered is the County of London, together with part of the Borough of West Ham, and the names and addresses are classified as follows :—

(1) By streets; (2) in alphabetical lists of the private residents, and of those engaged in any profession or business; (3) a classified trade section, comprising some 5,000 professions and trades, arranged alphabetically, each with a list arranged in alphabetical order of those engaged therein. Particulars are given of the establishments of the various Government Departments with an alphabetical list of officials; and separate sections are found for Chambers of Commerce (throughout the country); Law (including alphabetical lists of Barristers and Solicitors); Postal; City, municipal, parochial and clerical; Transport, hotel, etc., Banking, and so on (for the whole country). A street plan is included (scale four inches to the mile), and on the back of this is given a map of London and Suburbs (scale one inch to the mile), extending in some directions to 20 miles from Charing Cross. The price of this Directory is 55s., but a special edition, bound in leather, and printed on thicker paper, is priced at 70s.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A Copy will be sent by return, and your Remittance refunded if the Book does : : not satisfy your requirements : :

B. T. BATSFORD, LTD.
Publishers, 94 High Holborn, London, W.C.

PATENTS

APPLICATIONS PUBLISHED.*

257,242.—E. W. Rose : Wall footings for concrete buildings.

270,667.—M. Combemale : Metal furniture.

277,040.—J. Wild : Roof trusses.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

TRADE NEWS

Grosvenor House.

We learn that Messrs. Parker, Winder & nurch, Ltd., who supplied the May Fair tel with its lock furniture and other fittings, now under way with the complete locks ecial patent ball-bearing roller bolts), lock niture, finger-plates, sash fittings, ward- e fittings, etc., for Grosvenor House, Park- e, W.1. They are also the makers of the essary ventilators. The fittings were lered and selected by the contractors, ssrs. Grosvenor House, Ltd.

New Offices at Trowbridge.

We learn that the order for the central ting and hot-water supply apparatus for new offices of the Wiltshire Working n's Conservative Benefit Society, Trow- dge, has been placed with Mr. G. Apple- e, 82, Frome-road, Trowbridge. It will be nembered that the plans for these offices e the subject of an architectural competi- n which was won by Messrs. F. J. Lander l E. A. D. Tanner, AA.R.I.B.A., 22, rey-street, Strand, W.C.2, and illustrated *The Builder* for May 20.

A Catalogue of Radiators.

The National Radiator Co., Ltd., of Hull, ve, issued recently a new, complete cata- ue of their "Ideal" radiators and boilers. veral new types of apparatus are illus- ted for the first time, including the Im- oved Open-Fire domestic boiler, boilers for ticultural work, and boilers for oil fuel: ile several accessories are also new. We rn that all "Ideal" radiators and boilers subjected to a hydraulic test pressure of lb. per sq. in. The catalogue will gladly sent to any architect or contractor erested.

Rialto Cinema, Birmingham.

We understand that the laying of the rub- flooring on the main staircase, the side ngways and centre gangway, etc., of the erior of this cinema, illustrated in our issue December 16, was carried out by the Ioco bber and Waterproofing Co., Ltd., of niesland, Glasgow. Yet another job carried by this firm was at the Robin Hood nema, Birmingham. We learn that the Ioco mpany have prepared a shade card showing various designs of flooring executed by m. and this, together with a brochure and mples, will be sent upon application.

An Attractive Decorative Booklet.

The Fairfield Paint Co., of the London lour Works, White Horse-lane, E.1, have ued seasonable greetings in a most attrac- e manner. This takes the form of a oklet with a cover in a striking Wedgwood e and white design—illustrating in colour d half-tone several of the more important ildings which have been embellished and eserved by the use of this company's pro- cts, "Chynalyke" enamel, and the various Fairfield" paints. We illustrate on page 1 an example from the booklet, the Hast- s' White Rock Pavilion. Other examples wn are "Battersea Electric House," illus- ted in *The Builder* for December 2, 1927, Assembly Hall, Wandsworth Town Hall, d several theatres. Many charming ex- mples of cottage architecture—in which this n's Washable Distemper, awarded the edal of the Royal Sanitary Institute, has en used—are also given. The booklet may taken as an index to the quality and value the products of a very progressive firm.

Embankment Improvement.

The gap in the embankment wall between llbank Gardens and Vauxhall Bridge, we rn, is to be filled up. The London County uncil have invited tenders for an embank- nt wall to be built at this place similar the existing sections. The new wall will 565 ft. long when completed.
